009A 6.1.1 Foundations

009B **Definition 6.1.1.1.1 ► Pointed Sets**

A **pointed set**[1] is equivalently:

- An $\mathbb{E}_0$-monoid in $(\mathsf{N}_\bullet(\mathsf{Sets}), \mathrm{pt})$.
- A pointed object in $(\mathsf{Sets}, \mathrm{pt})$.

[1] *Further Terminology:* In the context of monoids with zero as models for $\mathbb{F}_1$-algebras, pointed sets are viewed as $\mathbb{F}_1$**-modules**.

009C **Remark 6.1.1.1.2 ► Unwinding Definition 6.1.1.1.1**

In detail, a **pointed set** is a pair (X, x_0) consisting of:

- *The Underlying Set.* A set X, called the **underlying set of** (X, x_0).
- *The Basepoint.* A morphism

$$[x_0] \colon \mathrm{pt} \to X$$

in Sets, determining an element $x_0 \in X$, called the **basepoint of** X.

009D **Example 6.1.1.1.3 ► The Zero Sphere**

The 0**-sphere**[1] is the pointed set $(S^0, 0)$[2] consisting of:

- *The Underlying Set.* The set S^0 defined by

$$S^0 \overset{\text{def}}{=} \{0, 1\}.$$

- *The Basepoint.* The element 0 of S^0.

[1] *Further Terminology:* In the context of monoids with zero as models for $\mathbb{F}_1$-algebras, the 0-sphere is viewed as the **underlying pointed set of the field with one element**.
[2] *Further Notation:* In the context of monoids with zero as models for $\mathbb{F}_1$-algebras, S^0 is also denoted $(\mathbb{F}_1, 0)$.

009E **Example 6.1.1.1.4 ▶ The Trivial Pointed Set**

The **trivial pointed set** is the pointed set $(\mathrm{pt}, \star)$ consisting of:

- *The Underlying Set.* The punctual set $\mathrm{pt} \overset{\text{def}}{=} \{\star\}$.
- *The Basepoint.* The element $\star$ of pt.

01QB **Example 6.1.1.1.5 ▶ The Standard Pointed Set With $n+1$ Elements**

The **standard pointed set with** $n+1$ **elements** is the pointed set $\langle n \rangle$ consisting of

- *The Underlying Set.* The set $\langle n \rangle$ defined by

$$\langle n \rangle \overset{\text{def}}{=} \{*\} \cup \{1, \ldots, n\}.$$

- *The Basepoint.* The element $*$ of $\langle n \rangle$.

009H 6.1.2 Morphisms of Pointed Sets

009J **Definition 6.1.2.1.1 ▶ Morphisms of Pointed Sets**

A **morphism of pointed sets**[1,2] is equivalently:

- A morphism of $\mathbb{E}_0$-monoids in $(\mathsf{N}_\bullet(\mathsf{Sets}), \mathrm{pt})$.
- A morphism of pointed objects in $(\mathsf{Sets}, \mathrm{pt})$.

[1] *Further Terminology:* Also called a **pointed function**.

[2] *Further Terminology:* In the context of monoids with zero as models for $\mathbb{F}_1$-algebras, morphisms of pointed sets are also called **morphism of** $\mathbb{F}_1$**-modules**.

009K **Remark 6.1.2.1.2 ▶ Unwinding Definition 6.1.2.1.1**

In detail, a **morphism of pointed sets** $f\colon (X, x_0) \to (Y, y_0)$ is a morphism of sets $f\colon X \to Y$ such that the diagram

$$\begin{tikzcd} & \mathrm{pt} \arrow[dl, "{[x_0]}"'] \arrow[dr, "{[y_0]}"] & \\ X \arrow[rr, "f"'] & & Y \end{tikzcd}$$

commutes, i.e. such that

$$f(x_0) = y_0.$$

009L ### 6.1.3 The Category of Pointed Sets

009M **Definition 6.1.3.1.1 ► The Category of Pointed Sets**

The **category of pointed sets** is the category Sets_* defined equivalently as:

- The homotopy category of the ∞-category $\mathsf{Mon}_{\mathbb{E}_0}(\mathrm{N}_\bullet(\mathsf{Sets}), \mathrm{pt})$ of **??**, **??**.
- The category Sets_* of Constructions With Categories, **??**.

009N **Remark 6.1.3.1.2 ► Unwinding Definition 6.1.3.1.1**

In detail, the **category of pointed sets** is the category Sets_* where:

- *Objects.* The objects of Sets_* are pointed sets.
- *Morphisms.* The morphisms of Sets_* are morphisms of pointed sets.
- *Identities.* For each $(X, x_0) \in \mathrm{Obj}(\mathsf{Sets}_*)$, the unit map

$$\mathbb{1}^{\mathsf{Sets}_*}_{(X,x_0)} \colon \mathrm{pt} \to \mathsf{Sets}_*((X, x_0), (X, x_0))$$

  of Sets_* at (X, x_0) is defined by[1]

$$\mathrm{id}^{\mathsf{Sets}_*}_{(X,x_0)} \stackrel{\text{def}}{=} \mathrm{id}_X .$$

- *Composition.* For each $(X, x_0), (Y, y_0), (Z, z_0) \in \mathrm{Obj}(\mathsf{Sets}_*)$, the composition map

$$\circ^{\mathsf{Sets}_*}_{(X,x_0),(Y,y_0),(Z,z_0)} \colon \mathsf{Sets}_*((Y, y_0), (Z, z_0)) \times \mathsf{Sets}_*((X, x_0), (Y, y_0)) \to \mathsf{Sets}_*((X, x_0), (Z, z_0))$$

  of Sets_* at $((X, x_0), (Y, y_0), (Z, z_0))$ is defined by[2]

$$g \circ^{\mathsf{Sets}_*}_{(X,x_0),(Y,y_0),(Z,z_0)} f \stackrel{\text{def}}{=} g \circ f.$$

[1] Note that id_X is indeed a morphism of pointed sets, as we have $\mathrm{id}_X(x_0) = x_0$.

[2]Note that the composition of two morphisms of pointed sets is indeed a morphism of pointed sets, as we have

$$
\begin{aligned}
g(f(x_0)) &= g(y_0)\\
&= z_0,
\end{aligned}
\qquad
\begin{tikzcd}
 & \mathrm{pt} \arrow[dl, "{[x_0]}"'] \arrow[d, "{[y_0]}"] \arrow[dr, "{[z_0]}"] & \\
X \arrow[r, "f"'] & Y \arrow[r, "g"'] & Z
\end{tikzcd}
$$

6.1.4 Elementary Properties of Pointed Sets

009Q **Proposition 6.1.4.1.1 ▶ Elementary Properties of Pointed Sets**

Let (X, x_0) be a pointed set.

009R 1. *Completeness.* The category Sets_* of pointed sets and morphisms between them is complete, having in particular:

009S (a) Products, described as in Definition 6.2.3.1.1.

009T (b) Pullbacks, described as in Definition 6.2.4.1.1.

009U (c) Equalisers, described as in Definition 6.2.5.1.1.

009V 2. *Cocompleteness.* The category Sets_* of pointed sets and morphisms between them is cocomplete, having in particular:

009W (a) Coproducts, described as in Definition 6.3.3.1.1.

009X (b) Pushouts, described as in Definition 6.3.4.1.1;

009Y (c) Coequalisers, described as in Definition 6.3.5.1.1.

009Z 3. *Failure To Be Cartesian Closed.* The category Sets_* is not Cartesian closed.[1]

00A0 4. *Morphisms From the Monoidal Unit.* We have a bijection of sets[2]

$$\mathsf{Sets}_*(S^0, X) \cong X,$$

natural in $(X, x_0) \in \mathrm{Obj}(\mathsf{Sets}_*)$, internalising also to an isomorphism of pointed sets

$$\mathbf{Sets}_*(S^0, X) \cong (X, x_0),$$

again natural in $(X, x_0) \in \mathrm{Obj}(\mathsf{Sets}_*)$.

00A1 5. *Relation to Partial Functions.* We have an equivalence of categories[3]

$$\mathsf{Sets}_* \overset{\text{eq.}}{\cong} \mathsf{Sets}^{\text{part.}}$$

between the category of pointed sets and pointed functions between them and the category of sets and partial functions between them, where:

024U (a) *From Pointed Sets to Sets With Partial Functions.* The equivalence

$$\xi\colon \mathsf{Sets}_* \xrightarrow{\cong} \mathsf{Sets}^{\text{part.}}$$

sends:

024V i. A pointed set (X, x_0) to X.

024W ii. A pointed function

$$f\colon (X, x_0) \to (Y, y_0)$$

to the partial function

$$\xi_f \colon X \to Y$$

defined on $f^{-1}(Y \setminus y_0)$ and given by

$$\xi_f(x) \overset{\text{def}}{=} f(x)$$

for each $x \in f^{-1}(Y \setminus y_0)$.

024X (b) *From Sets With Partial Functions to Pointed Sets.* The equivalence

$$\xi^{-1}\colon \mathsf{Sets}^{\text{part.}} \xrightarrow{\cong} \mathsf{Sets}_*$$

sends:

024Y i. A set X is to the pointed set $(X, \star)$ with $\star$ an element that is not in X.

024Z ii. A partial function

$$f\colon X \to Y$$

defined on $U \subset X$ to the pointed function

$$\xi_f^{-1}\colon (X, x_0) \to (Y, y_0)$$

defined by

$$\xi_f(x) \overset{\text{def}}{=} \begin{cases} f(x) & \text{if } x \in U, \\ y_0 & \text{otherwise.} \end{cases}$$

for each $x \in X$.

[1]The category Sets_* does admit a natural monoidal closed structure, however; see Tensor Products of Pointed Sets.

[2]In other words, the forgetful functor

$$忘 \colon \mathsf{Sets}_* \to \mathsf{Sets}$$

defined on objects by sending a pointed set to its underlying set is corepresentable by S^0.

[3]*Warning:* This is not an isomorphism of categories, only an equivalence.

Proof 6.1.4.1.2 ► Proof of Proposition 6.1.4.1.1

Item 1: Completeness

This follows from (the proofs) of Definitions 6.2.3.1.1, 6.2.4.1.1 and 6.2.5.1.1 and **??**.

Item 2: Cocompleteness

This follows from (the proofs) of Definitions 6.3.3.1.1, 6.3.4.1.1 and 6.3.5.1.1 and **??**.

Item 3: Failure To Be Cartesian Closed

See [`MSE 2855868`].

Item 4: Morphisms From the Monoidal Unit

Since a morphism from S^0 to a pointed set (X, x_0) sends $0 \in S^0$ to x_0 and then can send $1 \in S^0$ to any element of X, we obtain a bijection between pointed maps $S^0 \to X$ and the elements of X.

The isomorphism then

$$\mathbf{Sets}_*(S^0, X) \cong (X, x_0)$$

follows by noting that $\Delta_{x_0} \colon S^0 \to X$, the basepoint of $\mathbf{Sets}_*(S^0, X)$, corresponds to the pointed map $S^0 \to X$ picking the element x_0 of X, and thus we see that the bijection between pointed maps $S^0 \to X$ and elements of X is compatible with basepoints, lifting to an isomorphism of pointed sets.

Item 5: Relation to Partial Functions

See [`MSE 884460`].

01QC 6.1.5 Active and Inert Morphisms of Pointed Sets

01QD **Definition 6.1.5.1.1 ► Active and Inert Morphisms of Pointed Sets**

Let $f\colon (X, x_0) \to (Y, y_0)$ be a morphism of pointed sets.

01QE 1. The morphism f is **active** if $f^{-1}(y_0) = x_0$.

01QF 2. The morphism f is **inert** if, for each $y \in Y$, the set $f^{-1}(y)$ has exactly one element.

01QG **Notation 6.1.5.1.2 ► The Category of Pointed Sets and Active Morphisms**

We write $\mathsf{Sets}_*^{\mathsf{actv}}$ for the wide subcategory of Sets_* spanned by pointed sets and the active maps between them.

01QH **Example 6.1.5.1.3 ► Examples of Active and Inert Maps of Pointed Sets**

Here are some examples of active and inert maps of pointed sets.

01QJ 1. The map $\mu\colon \langle 2\rangle \to \langle 1\rangle$ given by

$$\begin{tikzcd}
1 \arrow[r, mapsto] & 1 \\
2 \arrow[ur, mapsto] & \\
* \arrow[r, mapsto] & *
\end{tikzcd}$$

is active but not inert.

01QK 2. The map $f\colon \langle 2\rangle \to \langle 2\rangle$ given by

$$\begin{tikzcd}
1 \arrow[r, mapsto] & 1 \\
2 \arrow[dr, mapsto] & 2 \\
* \arrow[r, mapsto] & *
\end{tikzcd}$$

is inert but not active.

01QL 3. The map $f\colon \langle 3\rangle \to \langle 1\rangle$ given by

$$\begin{tikzcd}
1 \arrow[r, mapsto] & 1 \\
2 \arrow[ur, mapsto] & \\
3 \arrow[dr, mapsto] & \\
* \arrow[r, mapsto] & *
\end{tikzcd}$$

is neither inert nor active. However, it factors as $f = a \circ i$, where

$$\begin{aligned} i &\colon \langle 3 \rangle \to \langle 2 \rangle, \\ a &\colon \langle 2 \rangle \to \langle 1 \rangle \end{aligned}$$

are the morphisms of pointed sets given by

$$\begin{array}{ccc} 1 & \longmapsto & 1 \\ 2 & \longmapsto & 2 \\ 3 & \longmapsto & * \\ * & \longmapsto & * \end{array} \qquad \begin{array}{ccc} 1 & \longmapsto & 1 \\ 2 & \longmapsto & 1 \\ * & \longmapsto & *, \end{array}$$

with i being inert and a being active.

01QM **Proposition 6.1.5.1.4 ▶ Properties of Active and Inert Maps of Pointed Sets**

Let (X, x_0) and (Y, y_0) be pointed sets.

01QN 1. *Active-Inert Factorisation.* Every morphism of pointed sets $f\colon (X, x_0) \to (Y, y_0)$ factors uniquely as

$$f = a \circ i,$$

where:

01QP (a) The map $i\colon (X, x_0) \to (K, k_0)$ is an inert morphism of pointed sets

01QQ (b) The map $a\colon (K, k_0) \to (Y, y_0)$ is an active morphism of pointed sets.

Moreover, this determines an orthogonal factorisation system in Sets_*.

Proof 6.1.5.1.5 ▶ Proof of Proposition 6.1.5.1.4

Item 1: Active-Inert Factorisation

Let $f\colon X \to Y$ be a morphism of pointed sets. We can factor f as

$$X \xrightarrow{i} K \xrightarrow{a} Y,$$

where:

- K is the pointed set given by

$$\begin{aligned} K &= \{x \in X \mid f(x) \neq y_0\} \cup \{x_0\} \\ &= (X \setminus f^{-1}(y_0)) \cup \{x_0\}; \end{aligned}$$

- $i\colon X \to K$ is the inert morphism of pointed sets given by

$$i(x) \overset{\text{def}}{=} \begin{cases} x & \text{if } x \in K, \\ x_0 & \text{otherwise} \end{cases}$$

  for each $x \in X$;

- $a\colon K \to Y$ is the active morphism of pointed sets given by

$$a(x) \overset{\text{def}}{=} f(x)$$

  for each $x \in K$.

Next, let

$$\begin{tikzcd} X \arrow[r, "i"] \arrow[d, "f"'] & Y \arrow[d, "g"] \\ A \arrow[r, "a"'] & B \end{tikzcd}$$

be a commutative diagram in Sets_*. Consider the morphism $\phi\colon Y \to A$ given by

$$\phi(y) = f(i^{-1}(y))$$

for each $y \in Y$ (which is well-defined since, as i is inert, $i^{-1}(y)$ is a singleton for all $y \in Y$). We claim that ϕ is the unique diagonal filler in the diagram

$$\begin{tikzcd} X \arrow[r, "i"] \arrow[d, "f"'] & Y \arrow[d, "g"] \arrow[dl, dashed, "\exists!"', "\phi"] \\ A \arrow[r, "a"'] & B. \end{tikzcd}$$

Indeed, this diagram commutes, as we have

$$\begin{aligned}[\phi \circ i](x) &\overset{\text{def}}{=} \phi(i(x))\\ &\overset{\text{def}}{=} f(i^{-1}(i(x)))\\ &= f(x)\end{aligned}$$

for each $x \in X$ and

$$\begin{aligned}[a \circ \phi](y) &\overset{\text{def}}{=} a(\phi(y))\\ &\overset{\text{def}}{=} a(f(i^{-1}(y)))\\ &\overset{\text{def}}{=} [a \circ f](i^{-1}(y))\\ &= [g \circ i](i^{-1}(y))\\ &\overset{\text{def}}{=} g(i(i^{-1}(y)))\\ &\overset{\text{def}}{=} g(y)\end{aligned}$$

for each $y \in Y$. Moreover, given another morphism ψ such that the diagram

$$\begin{tikzcd} X \arrow[r, "i"] \arrow[d, "f"'] & Y \arrow[d, "g"] \arrow[dl, dashed, "\psi"'] \\ A \arrow[r, "a"'] & B \end{tikzcd}$$

commutes, it follows that we must have $\psi = \phi$, since, given $y \in Y$, there exists a unique $x \in X$ such that $i(x) = y$, so we have

$$\begin{aligned}\psi(y) &= \psi(i(x))\\ &= f(x)\\ &= f(i^{-1}(y))\\ &\overset{\text{def}}{=} \phi(y).\end{aligned}$$

This finishes the proof. ∎

00A2 6.2 Limits of Pointed Sets

00A3 6.2.1 The Terminal Pointed Set

00A4 **Definition 6.2.1.1.1 ▶ The Terminal Pointed Set**

The **terminal pointed set** is the terminal object of Sets_* as in Limits and Colimits, **??**.

0250 **Construction 6.2.1.1.2 ▶ Construction of the Terminal Pointed Set**

Concretely, the **terminal pointed set** is the pair $((\mathrm{pt}, \star), \{!_X\}_{(X,x_0)\in\mathrm{Obj}(\mathsf{Sets}_*)})$ consisting of:

- *The Limit.* The pointed set $(\mathrm{pt}, \star)$.
- *The Cone.* The collection of morphisms of pointed sets

  $$\{!_X : (X, x_0) \to (\mathrm{pt}, \star)\}_{(X,x_0)\in\mathrm{Obj}(\mathsf{Sets})}$$

  defined by

  $$!_X(x) \stackrel{\mathrm{def}}{=} \star$$

  for each $x \in X$ and each $(X, x_0) \in \mathrm{Obj}(\mathsf{Sets})$.

Proof 6.2.1.1.3 ▶ Proof of Construction 6.2.1.1.2

We claim that $(\mathrm{pt}, \star)$ is the terminal object of Sets_*. Indeed, suppose we have a diagram of the form

$$(X, x_0) \qquad (\mathrm{pt}, \star)$$

in Sets_*. Then there exists a unique morphism of pointed sets

$$\phi : (X, x_0) \to (\mathrm{pt}, \star)$$

making the diagram

$$(X, x_0) \xrightarrow[\exists!]{\phi} (\mathrm{pt}, \star)$$

commute, namely $!_X$.

00A5 6.2.2 Products of Families of Pointed Sets

Let $\{(X_i, x_0^i)\}_{i\in I}$ be a family of pointed sets.

00A6 **Definition 6.2.2.1.1 ▶ The Product of a Family of Pointed Sets**

The **product of** $\{(X_i, x_0^i)\}_{i\in I}$ is the product of $\{(X_i, x_0^i)\}_{i\in I}$ in Sets_* as in Limits and Colimits, **??**.

0251 **Construction 6.2.2.1.2 ▶ Construction of the Product of a Family of Pointed Sets**

Concretely, the **product of** $\{(X_i, x_0^i)\}_{i\in I}$ is the pair $((\prod_{i\in I} X_i, (x_0^i)_{i\in I}), \{\mathrm{pr}_i\}_{i\in I})$ consisting of:

- *The Limit.* The pointed set $(\prod_{i\in I} X_i, (x_0^i)_{i\in I})$.
- *The Cone.* The collection

$$\left\{\mathrm{pr}_i\colon \left(\prod_{i\in I} X_i, (x_0^i)_{i\in I}\right) \to (X_i, x_0^i)\right\}_{i\in I}$$

  of maps given by

$$\mathrm{pr}_i((x_j)_{j\in I}) \overset{\text{def}}{=} x_i$$

  for each $(x_j)_{j\in I} \in \prod_{i\in I} X_i$ and each $i \in I$.

Proof 6.2.2.1.3 ▶ Proof of Construction 6.2.2.1.2

We claim that $(\prod_{i\in I} X_i, (x_0^i)_{i\in I})$ is the categorical product of $\{(X_i, x_0^i)\}_{i\in I}$ in Sets_*. Indeed, suppose we have, for each $i \in I$, a diagram of the form

$$\begin{tikzcd}
& (P, *) \arrow[dr, "p_i"] & \\
& (\prod_{i\in I} X_i, (x_0^i)_{i\in I}) \arrow[r, "\mathrm{pr}_i"'] & (X_i, x_0^i)
\end{tikzcd}$$

in Sets_*. Then there exists a unique morphism of pointed sets

$$\phi\colon (P, *) \to \left(\prod_{i\in I} X_i, (x_0^i)_{i\in I}\right)$$

making the diagram

$$\begin{tikzcd} (P,*) \arrow[d, dashed, "\phi"', "\exists!"] \arrow[dr, "p_i"] & \\ \left(\prod_{i\in I} X_i, (x_0^i)_{i\in I}\right) \arrow[r, "\mathrm{pr}_i"'] & (X_i, x_0^i) \end{tikzcd}$$

commute, being uniquely determined by the condition $\mathrm{pr}_i \circ \phi = p_i$ for each $i \in I$ via

$$\phi(x) = (p_i(x))_{i\in I}$$

for each $x \in P$. Note that this is indeed a morphism of pointed sets, as we have

$$\begin{aligned} \phi(*) &= (p_i(*))_{i\in I} \\ &= (x_0^i)_{i\in I}, \end{aligned}$$

where we have used that p_i is a morphism of pointed sets for each $i \in I$. ∎

00A7 **Proposition 6.2.2.1.4 ▶ Properties of Products of Families of Pointed Sets**

Let $\{(X_i, x_0^i)\}_{i\in I}$ be a family of pointed sets.

00A8 1. *Functoriality*. The assignment $\{(X_i, x_0^i)\}_{i\in I} \mapsto \left(\prod_{i\in I} X_i, (x_0^i)_{i\in I}\right)$ defines a functor

$$\prod_{i\in I} \colon \mathsf{Fun}(I_{\mathsf{disc}}, \mathsf{Sets}_*) \to \mathsf{Sets}_*.$$

Proof 6.2.2.1.5 ▶ Proof of Proposition 6.2.2.1.4

Item 1: Functoriality

This follows from Limits and Colimits, **??** of **??**. ∎

00A9 6.2.3 Products

Let (X, x_0) and (Y, y_0) be pointed sets.

00AA **Definition 6.2.3.1.1 ► Products of Pointed Sets**

0252 **Construction 6.2.3.1.2 ► Construction of Products of Pointed Sets**

Concretely, the **product of** (X, x_0) **and** (Y, y_0) is the pair consisting of:

- *The Limit.* The pointed set $(X \times Y, (x_0, y_0))$.
- *The Cone.* The morphisms of pointed sets

  $$\begin{aligned}\mathrm{pr}_1 &\colon (X \times Y, (x_0, y_0)) \to (X, x_0),\\ \mathrm{pr}_2 &\colon (X \times Y, (x_0, y_0)) \to (Y, y_0)\end{aligned}$$

  defined by

  $$\begin{aligned}\mathrm{pr}_1(x, y) &\stackrel{\text{def}}{=} x,\\ \mathrm{pr}_2(x, y) &\stackrel{\text{def}}{=} y\end{aligned}$$

  for each $(x, y) \in X \times Y$.

Proof 6.2.3.1.3 ► Proof of Construction 6.2.3.1.2

We claim that $(X \times Y, (x_0, y_0))$ is the categorical product of (X, x_0) and (Y, y_0) in Sets_*. Indeed, suppose we have a diagram of the form

$$\begin{tikzcd}

commute, being uniquely determined by the conditions

$$\begin{aligned}\mathrm{pr}_1\circ\phi &= p_1,\\ \mathrm{pr}_2\circ\phi &= p_2\end{aligned}$$

via

$$\phi(x)=(p_1(x),p_2(x))$$

for each $x\in P$. Note that this is indeed a morphism of pointed sets, as we have

$$\begin{aligned}\phi(*) &= (p_1(*),p_2(*))\\ &= (x_0,y_0),\end{aligned}$$

where we have used that p_1 and p_2 are morphisms of pointed sets.

defined in the same way as the functors of Constructions With Sets, Item 1 of Proposition 4.1.3.1.4.

01QR 2. *Lack of Adjointness.* The functors $X \times -$ and $- \times Y$ do not admit right adjoints.

00AD 3. *Associativity.* We have an isomorphism of pointed sets

natural in $(X, x_0), (Y, y_0), (Z, z_0) \in \mathrm{Obj}(\mathsf{Sets}_*)$.

00AE 4. *Unitality.* We have isomorphisms of pointed sets

6.2.4 Pullbacks

Let (X, x_0), (Y, y_0), and (Z, z_0) be pointed sets and let $f: (X, x_0) \to (Z, z_0)$ and $g: (Y, y_0) \to (Z, z_0)$ be morphisms of pointed sets.

Definition 6.2.4.1.1 ▶ Pullbacks of Pointed Sets

The **pullback of** (X, x_0) **and** (Y, y_0) **over** (Z, z_0) **along** (f, g) is the pullback of (X, x_0) and (Y, y_0) over (Z, z_0) along (f, g) in Sets_* as in Limits and Colimits, **??**.

0253
Construction 6.2.4.1.2 ▶ Construction of Pullbacks of Pointed Sets

Concretely, the **pullback of** (X, x_0) **and** (Y, y_0) **over** (Z, z_0) **along** (f, g) is the pair consisting of:

- *The Limit.* The pointed set $(X \times_Z Y, (x_0, y_0))$.
- *The Cone.* The morphisms of pointed sets

$$\begin{aligned} \mathrm{pr}_1 &: (X \times_Z Y, (x_0, y_0)) \to (X, x_0), \\ \mathrm{pr}_2 &: (X \times_Z Y, (x_0, y_0)) \to (Y, y_0) \end{aligned}$$

  defined by

$$\begin{aligned} \mathrm{pr}_1(x, y) &\stackrel{\text{def}}{=} x, \\ \mathrm{pr}_2(x, y) &\stackrel{\text{def}}{=} y \end{aligned}$$

  for each $(x, y) \in X \times_Z Y$.

Proof 6.2.4.1.3 ▶ Proof of Construction 6.2.4.1.2

We claim that $X \times_Z Y$ is the categorical pullback of (X, x_0) and (Y, y_0) over (Z, z_0) with respect to (f, g) in Sets_*. First we need to check that the relevant pullback diagram commutes, i.e. that we have

$$f \circ \mathrm{pr}_1 = g \circ \mathrm{pr}_2, \qquad \begin{tikzcd} (X \times_Z Y, (x_0, y_0)) \arrow[r, "\mathrm{pr}_2"] \arrow[d, "\mathrm{pr}_1"'] & (Y, y_0) \arrow[d, "g"] \\ (X, x_0) \arrow[r, "f"'] & (Z, z_0). \end{tikzcd}$$

Indeed, given $(x, y) \in X \times_Z Y$, we have

$$\begin{aligned} [f \circ \mathrm{pr}_1](x, y) &= f(\mathrm{pr}_1(x, y)) \\ &= f(x) \\ &= g(y) \\ &= g(\mathrm{pr}_2(x, y)) \\ &= [g \circ \mathrm{pr}_2](x, y), \end{aligned}$$

where $f(x) = g(y)$ since $(x, y) \in X \times_Z Y$. Next, we prove that $X \times_Z Y$ satisfies the universal property of the pullback. Suppose we have a diagram of the form

$$\begin{tikzcd} (P, *) \arrow[drr, bend left, "p_2"] \arrow[ddr, bend right, "p_1"'] & & \\ & (X \times_Z Y, (x_0, y_0)) \arrow[r, dashed, "\mathrm{pr}_2"] \arrow[d, dashed, "\mathrm{pr}_1"] \arrow[dr, phantom, "\lrcorner", very near start] & (Y, y_0) \arrow[d, "g"] \\ & (X, x_0) \arrow[r, "f"'] & (Z, z_0) \end{tikzcd}$$

in Sets_*. Then there exists a unique morphism of pointed sets

$$\phi\colon (P, *) \longrightarrow (X \times_Z Y, (x_0, y_0))$$

making the diagram

$$
\begin{tikzcd}
(P,*) \arrow[rrd, bend left, "p_2"] \arrow[rdd, bend right, "p_1"'] \arrow[rd, dashed, "\phi", "\exists!"'] & & \\
& (X \times_Z Y, (x_0, y_0)) \arrow[r, "\mathrm{pr}_2"] \arrow[d, "\mathrm{pr}_1"'] \arrow[dr, phantom, "\lrcorner", very near start] & (Y, y_0) \arrow[d, "g"] \\
& (X, x_0) \arrow[r, "f"'] & (Z, z_0)
\end{tikzcd}
$$

commute, being uniquely determined by the conditions

$$
\begin{aligned}
\mathrm{pr}_1 \circ \phi &= p_1, \\
\mathrm{pr}_2 \circ \phi &= p_2
\end{aligned}
$$

via

$$\phi(x) = (p_1(x), p_2(x))$$

for each $x \in P$, where we note that $(p_1(x), p_2(x)) \in X \times Y$ indeed lies in $X \times_Z Y$ by the condition

$$f \circ p_1 = g \circ p_2,$$

which gives

$$f(p_1(x)) = g(p_2(x))$$

for each $x \in P$, so that $(p_1(x), p_2(x)) \in X \times_Z Y$. Lastly, we note that ϕ is indeed a morphism of pointed sets, as we have

$$
\begin{aligned}
\phi(*) &= (p_1(*), p_2(*)) \\
&= (x_0, y_0),
\end{aligned}
$$

where we have used that p_1 and p_2 are morphisms of pointed sets.

Naturality for the transformation ∇ is the statement that, given a morphism of pointed sets $f : (X, x_0) \longrightarrow (Y, y_0)$, we have

6.3.4 Pushouts

Let (X, x_0), (Y, y_0), and (Z, z_0) be pointed sets and let $f\colon (Z, z_0) \to (X, x_0)$ and $g\colon (Z, z_0) \to (Y, y_0)$ be morphisms of pointed sets.

00BF

Definition 6.3.4.1.1 ► Pushouts of Pointed Sets

The **pushout of** (X, x_0) **and** (Y, y_0) **over** (Z, z_0) **along** (f, g) is the pushout of (X, x_0) and (Y, y_0) over (Z, z_0) along (f, g) in Sets_* as in Limits and Colimits, **??**.

0258

Construction 6.3.4.1.2 ► Construction of Pushouts of Pointed Sets

Concretely, the **pushout of** (X, x_0) **and** (Y, y_0) **over** (Z, z_0) **along** (f, g) is the pair consisting of:

- *The Colimit.* The pointed set $(X \coprod_{f,Z,g} Y, p_0)$, where:
  - The set $X \coprod_{f,Z,g} Y$ is the pushout (of unpointed sets) of X and Y over Z with respect to f and g;
  - We have $p_0 = [x_0] = [y_0]$.
- *The Cocone.* The morphisms of pointed sets

$$
\begin{aligned}
\mathrm{inj}_1 &\colon (X, x_0) \to (X \textstyle\coprod_Z Y, p_0),\\
\mathrm{inj}_2 &\colon (Y, y_0) \to (X \textstyle\coprod_Z Y, p_0)
\end{aligned}
$$

  given by

$$
\begin{aligned}
\mathrm{inj}_1(x) &\stackrel{\text{def}}{=} [(0, x)]\\
\mathrm{inj}_2(y) &\stackrel{\text{def}}{=} [(1, y)]
\end{aligned}
$$

  for each $x \in X$ and each $y \in Y$.

PROOF 6.3.4.1.3 ▶ PROOF OF ??

Firstly, we note that indeed $[x_0] = [y_0]$, as we have

$$\begin{aligned} x_0 &= f(z_0), \\ y_0 &= g(z_0) \end{aligned}$$

since f and g are morphisms of pointed sets, with the relation $\sim$ on $X \coprod_Z Y$ then identifying $x_0 = f(z_0) \sim g(z_0) = y_0$.
We now claim that $(X \coprod_Z Y, p_0)$ is the categorical pushout of (X, x_0) and (Y, y_0) over (Z, z_0) with respect to (f, g) in Sets_*. First we need to check that the relevant pushout diagram commutes, i.e. that we have

$$\mathrm{inj}_1 \circ f = \mathrm{inj}_2 \circ g, \qquad \begin{tikzcd} (X \coprod_Z Y, p_0) & (Y, y_0) \arrow[l, "\mathrm{inj}_2"'] \\ (X, x_0) \arrow[u, "\mathrm{inj}_1"] & (Z, z_0). \arrow[l, "f"] \arrow[u, "g"'] \end{tikzcd}$$

Indeed, given $z \in Z$, we have

$$\begin{aligned} [\mathrm{inj}_1 \circ f](z) &= \mathrm{inj}_1(f(z)) \\ &= [(0, f(z))] \\ &= [(1, g(z))] \\ &= \mathrm{inj}_2(g(z)) \\ &= [\mathrm{inj}_2 \circ g](z), \end{aligned}$$

where $[(0, f(z))] = [(1, g(z))]$ by the definition of the relation $\sim$ on $X \coprod Y$ (the coproduct of unpointed sets of X and Y). Next, we prove that $X \coprod_Z Y$ satisfies the universal property of the pushout. Suppose we have a diagram of the form

$$\begin{tikzcd} (P, *) & & \\ & (X \coprod_Z Y, p_0) \arrow[ul, dashed] & (Y, y_0) \arrow[l, "\mathrm{inj}_2"'] \arrow[ull, bend right, "\iota_2"'] \\ & (X, x_0) \arrow[u, "\mathrm{inj}_1"] \arrow[uu, bend left, "\iota_1"] \arrow[ur, phantom, "\ulcorner"] & (Z, z_0) \arrow[l, "f"] \arrow[u, "g"'] \end{tikzcd}$$

in Sets_*. Then there exists a unique morphism of pointed sets

$$\phi\colon (X \textstyle\coprod_Z Y, p_0) \to (P, *)$$

making the diagram

$$\begin{tikzcd}
(P,*) & & \\
& (X \coprod_Z Y, p_0) \arrow[ul, dashed, "\exists!", "\phi"'] & (Y, y_0) \arrow[l, "\mathrm{inj}_2"'] \arrow[ull, bend right, "\iota_2"'] \\
& (X, x_0) \arrow[u, "\mathrm{inj}_1"] \arrow[uul, bend left, "\iota_1"] & (Z, z_0) \arrow[l, "f"] \arrow[u, "g"']
\end{tikzcd}$$

commute, being uniquely determined by the conditions

$$\begin{aligned}
\phi \circ \mathrm{inj}_1 &= \iota_1, \\
\phi \circ \mathrm{inj}_2 &= \iota_2
\end{aligned}$$

via

$$\phi(p) = \begin{cases} \iota_1(x) & \text{if } x = [(0, x)], \\ \iota_2(y) & \text{if } x = [(1, y)] \end{cases}$$

for each $p \in X \coprod_Z Y$, where the well-definedness of ϕ is proven in the same way as in the proof of Constructions With Sets, Definition 4.2.4.1.1. Finally, we show that ϕ is indeed a morphism of pointed sets, as we have

$$\begin{aligned}
\phi(p_0) &= \phi([(0, x_0)]) \\
&= \iota_1(x_0) \\
&= *,
\end{aligned}$$

or alternatively

$$\begin{aligned}
\phi(p_0) &= \phi([(1, y_0)]) \\
&= \iota_2(y_0) \\
&= *,
\end{aligned}$$

where we use that ι_1 (resp. ι_2) is a morphism of pointed sets.

00BG **PROPOSITION 6.3.4.1.4 ► PROPERTIES OF PUSHOUTS OF POINTED SETS**

00BH 1. *Functoriality.* The assignment $(X, Y, Z, f, g) \mapsto X \coprod_{f,Z,g} Y$ defines a functor

$$\begin{tikzcd} & \bullet \\ \bullet & \bullet. \arrow[l] \arrow[u] \end{tikzcd}$$
In particular, the action on morphisms of $-_1 \coprod_{-_3} -_1$ is given by sending a morphism

0259 **CONSTRUCTION 6.3.5.1.2 ► CONSTRUCTION OF COEQUALISERS OF POINTED SETS**

The **coequaliser of** (f, g) is the pair $((\mathrm{CoEq}(f, g), [y_0]), \mathrm{coeq}(f, g))$ consisting of:

- *The Colimit.* The pointed set $(\mathrm{CoEq}(f, g), [y_0])$, where $\mathrm{CoEq}(f, g)$ is the coequaliser of f and g as in Constructions With Sets, Definition 4.2.5.1.1.
- *The Cocone.* The map

  given by the quotient map, as in Constructions With Sets, Item 2 of Construction 4.2.5.1.2.

PROOF 6.3.5.1.3 ► PROOF OF CONSTRUCTION 6.3.5.1.2

We claim that $(\mathrm{CoEq}(f, g), [y_0])$ is the categorical coequaliser of f and g in Sets_*. First we need to check that the relevant coequaliser diagram commutes, i.e. that we have

$$\mathrm{coeq}(f, g) \circ f = \mathrm{coeq}(f, g) \circ g.$$

Indeed, we have

in Sets. Then, since $c(f(a)) = c(g(a))$ for each $a \in A$, it follows from Conditions on Relations, Items 4 and 5 of Proposition 10.6.2.1.3 that there exists a unique map $\phi\colon \mathrm{CoEq}(f,g) \xrightarrow{\exists!} C$ making the diagram

$$
\begin{aligned}
\phi([y_0]) &= [\phi \circ \mathrm{coeq}(f,g)]([y_0]) \\

$$(-)^{+,\coprod}_{\mathbb{1}} \colon \mathrm{pt} \overset{\sim}{\dashrightarrow} \emptyset^+,$$

natural in $X, Y \in \mathrm{Obj}(\mathsf{Sets})$.

00C2 4. *Symmetric Strong Monoidality With Respect to Smash Products.* The free pointed set functor of Item 1 has a symmetric strong monoidal structure

$$((-)^+, (-)^+, (-)^+_{\mathbb{1}}) \colon (\mathsf{Sets}, \times, \mathrm{pt}) \to (\mathsf{Sets}_*, \wedge, S^0),$$

being equipped with isomorphisms of pointed sets

$$(-)^+_{X,Y} \colon X^+ \wedge Y^+ \overset{\sim}{\dashrightarrow} (X \times Y)^+,$$
$$(-)^+_{\mathbb{1}} \colon S^0 \overset{\sim}{\dashrightarrow} \mathrm{pt}^+,$$

natural in $X, Y \in \mathrm{Obj}(\mathsf{Sets})$.

PROOF 6.4.1.1.3 ▶ PROOF OF PROPOSITION 6.4.1.1.2

Item 1: Functoriality

We claim that $(-)^+$ is indeed a functor:

- *Preservation of Identities.* Let $X \in \mathrm{Obj}(\mathsf{Sets})$. We have

$$\mathrm{id}^+_X(x) \overset{\text{def}}{=} \begin{cases} x & \text{if } x \in X, \\ \star_X & \text{if } x = \star_X, \end{cases}$$

for each $x \in X^+$, so $\mathrm{id}^+_X = \mathrm{id}_{X^+}$.

- *Preservation of Composition.* Given morphisms of sets

$$\begin{aligned} f &: X \longrightarrow Y, \\ g &: Y \longrightarrow Z, \end{aligned}$$

we have

$$\begin{aligned} [g^+ \circ f^+](x) &\stackrel{\text{def}}{=} g^+(f^+(x)) \\ &\stackrel{\text{def}}{=} g^+(f(x)) \\ &\stackrel{\text{def}}{=} g(f(x)) \\ &\stackrel{\text{def}}{=} [g \circ f]^+(x) \end{aligned}$$

for each $x \in X$ and

$$\begin{aligned} [g^+ \circ f^+](\star_X) &\stackrel{\text{def}}{=} g^+(f^+(\star_X)) \\ &\stackrel{\text{def}}{=} g^+(\star_Y) \\ &\stackrel{\text{def}}{=} \star_Z \\ &\stackrel{\text{def}}{=} [g \circ f]^+(\star_X), \end{aligned}$$

so $(g \circ f)^+ = g^+ \circ f^+$.

This finishes the proof.

Item 2: Adjointness

We proceed in a few steps:

025A
- *Map I.* We define a map

$$\Phi_{X,Y} \colon \mathsf{Sets}_*(X^+, Y) \longrightarrow \mathsf{Sets}(X, Y)$$

by sending a morphism of pointed sets

$$\xi \colon (X^+, \star_X) \longrightarrow (Y, y_0)$$

to the function

$$\xi^\dagger \colon X \longrightarrow Y$$

given by

$$\xi^\dagger(x) \stackrel{\text{def}}{=} \xi(x)$$

for each $x \in X$.

025B • *Map II.* We define a map

$$\Psi_{X,Y} \colon \mathsf{Sets}(X, Y) \to \mathsf{Sets}_*(X^+, Y)$$

given by sending a function $\xi \colon X \to Y$ to the morphism of pointed sets

$$\xi^\dagger \colon (X^+, \star_X) \to (Y, y_0)$$

defined by

$$\xi^\dagger(x) \stackrel{\text{def}}{=} \begin{cases} \xi(x) & \text{if } x \in X, \\ y_0 & \text{if } x = \star_X \end{cases}$$

for each $x \in X^+$.

025C • *Invertibility I.* Given a morphism of pointed sets

$$\xi \colon (X^+, \star_X) \to (Y, y_0),$$

we have

$$\begin{aligned} [\Psi_{X,Y} \circ \Phi_{X,Y}](\xi) &\stackrel{\text{def}}{=} \Psi_{X,Y}(\Phi_{X,Y}(\xi)) \\ &= \Psi_{X,Y}(\xi^\dagger) \\ &\stackrel{\text{def}}{=} \left[\!\left[x \mapsto \begin{cases} \xi^\dagger(x) & \text{if } x \in X \\ y_0 & \text{if } x = \star_X \end{cases} \right]\!\right] \\ &= \left[\!\left[x \mapsto \begin{cases} \xi(x) & \text{if } x \in X \\ y_0 & \text{if } x = \star_X \end{cases} \right]\!\right] \\ &= \xi \\ &\stackrel{\text{def}}{=} [\mathrm{id}_{\mathsf{Sets}_*(X^+,Y)}](\xi). \end{aligned}$$

Therefore we have

$$\Psi_{X,Y} \circ \Phi_{X,Y} = \mathrm{id}_{\mathsf{Sets}_*(X^+,Y)}.$$

025D • *Invertibility II.* Given a map of sets $\xi \colon X \to Y$, we have

$$\begin{aligned} [\Phi_{X,Y} \circ \Psi_{X,Y}](\xi) &\stackrel{\text{def}}{=} \Phi_{X,Y}(\Psi_{X,Y}(\xi)) \\ &= \Phi_{X,Y}(\xi^\dagger) \end{aligned}$$

$$
\begin{aligned}
&= \Phi_{X,Y}\left(\left[\!\left[x \mapsto \begin{cases} \xi(x) & \text{if } x \in X \\ y_0 & \text{if } x = \star_X \end{cases} \right]\!\right]\right) \\
&= [\![x \mapsto \xi(x)]\!] \\
&= \xi \\
&\stackrel{\text{def}}{=} [\mathrm{id}_{\mathsf{Sets}(X,Y)}](\xi).
\end{aligned}
$$

Therefore we have

$$\Phi_{X,Y} \circ \Psi_{X,Y} = \mathrm{id}_{\mathsf{Sets}(X,Y)}\,.$$

025E
- *Naturality for Φ, Part I.* We need to show that, given a morphism of pointed sets

$$f\colon (X, x_0) \to (X', x_0'),$$

the diagram

$$
\begin{tikzcd}
\mathsf{Sets}_*(X'^{,+}, Y) \arrow[r, "\Phi_{X',Y}"] \arrow[d, "f^*"'] & \mathsf{Sets}(X', Y) \arrow[d, "f^*"] \\
\mathsf{Sets}_*(X^+, Y) \arrow[r, "\Phi_{X,Y}"'] & \mathsf{Sets}(X, Y)
\end{tikzcd}
$$

commutes. Indeed, given a morphism of pointed sets $\xi\colon X'^{,+} \to Y$, we have

$$
\begin{aligned}
[\Phi_{X,Y} \circ f^*](\xi) &= \Phi_{X,Y}(f^*(\xi)) \\
&= \Phi_{X,Y}(\xi \circ f) \\
&= \xi \circ f \\
&= \Phi_{X',Y}(\xi) \circ f \\
&= f^*(\Phi_{X',Y}(\xi)) \\
&= f^*(\Phi_{X',Y}(\xi)) \\
&= [f^* \circ \Phi_{X',Y}](\xi).
\end{aligned}
$$

Therefore we have

$$\Phi_{X,Y} \circ f^* = f^* \circ \Phi_{X',Y}$$

and the naturality diagram for Φ above indeed commutes.

025F • *Naturality for Φ, Part II.* We need to show that, given a morphism of pointed sets

$$g: (Y, y_0) \to (Y', y_0'),$$

the diagram

$$\begin{tikzcd} \mathsf{Sets}_*(X^+, Y) \arrow[r, "\Phi_{X,Y}"] \arrow[d, "g_*"'] & \mathsf{Sets}(X, Y) \arrow[d, "g_*"] \\ \mathsf{Sets}_*(X^+, Y'), \arrow[r, "\Phi_{X,Y'}"'] & \mathsf{Sets}(X, Y') \end{tikzcd}$$

commutes. Indeed, given a morphism of pointed sets

$$\xi^\dagger: X^+ \to Y,$$

we have

$$\begin{aligned}
[\Phi_{X,Y'} \circ g_*](\xi) &= \Phi_{X,Y'}(g_*(\xi)) \\
&= \Phi_{X,Y'}(g \circ \xi) \\
&= g \circ \xi \\
&= g \circ \Phi_{X,Y'}(\xi) \\
&= g_*(\Phi_{X,Y'}(\xi)) \\
&= [g_* \circ \Phi_{X,Y'}](\xi).
\end{aligned}$$

Therefore we have

$$\Phi_{X,Y'} \circ g_* = g_* \circ \Phi_{X,Y'}$$

and the naturality diagram for Φ above indeed commutes.

025G • *Naturality for Ψ.* Since Φ is natural in each argument and Φ is a componentwise inverse to Ψ in each argument, it follows from Categories, Item 2 of Proposition 11.9.7.1.2 that Ψ is also natural in each argument.

This finishes the proof.

Item 3: Symmetric Strong Monoidality With Respect to Wedge Sums

We construct the strong monoidal structure on $(-)^+$ with respect to $\coprod$ and $\vee$ as follows:

- *The Strong Monoidality Constraints.* The isomorphism

$$(-)^{+,\coprod}_{X,Y} \colon X^+ \vee Y^+ \xrightarrow{\sim} (X \coprod Y)^+$$

is given by

$$(-)^{+,\coprod}_{X,Y}(z) = \begin{cases} x & \text{if } z = [(0,x)] \text{ with } x \in X, \\ y & \text{if } z = [(1,y)] \text{ with } y \in Y, \\ \star_{X\coprod Y} & \text{if } z = [(0,\star_X)], \\ \star_{X\coprod Y} & \text{if } z = [(1,\star_Y)] \end{cases}$$

for each $z \in X^+ \vee Y^+$, with inverse

$$(-)^{+,\coprod,-1}_{X,Y} \colon (X \coprod Y)^+ \xrightarrow{\sim} X^+ \vee Y^+$$

given by

$$(-)^{+,\coprod,-1}_{X,Y}(z) \overset{\text{def}}{=} \begin{cases} [(0,x)] & \text{if } z = [(0,x)], \\ [(1,y)] & \text{if } z = [(1,y)], \\ p_0 & \text{if } z = \star_{X\coprod Y} \end{cases}$$

for each $z \in (X \coprod Y)^+$.

- *The Strong Monoidal Unity Constraint.* The isomorphism

$$(-)^{+,\coprod,\mathbb{1}}_{X,Y} \colon \mathrm{pt} \xrightarrow{\sim} \emptyset^+$$

is given by sending $\star_X$ to $\star_\emptyset$.

The verification that these isomorphisms satisfy the coherence conditions making the functor $(-)^+$ into a symmetric strong monoidal functor is omitted.

Item 4: Symmetric Strong Monoidality With Respect to Smash Products

We construct the strong monoidal structure on $(-)^+$ with respect to $\times$ and $\wedge$ as follows:

- *The Strong Monoidality Constraints.* The isomorphism

$$(-)^{+}_{X,Y} \colon X^+ \wedge Y^+ \xrightarrow{\sim} (X \times Y)^+$$

is given by

$$(-)^{+}_{X,Y}(x \wedge y) = \begin{cases} (x,y) & \text{if } x \neq \star_X \text{ and } y \neq \star_Y \\ \star_{X\times Y} & \text{otherwise} \end{cases}$$

for each $x \wedge y \in X^+ \wedge Y^+$, with inverse

$$(-)^{+,-1}_{X,Y} \colon (X \times Y)^+ \overset{\sim}{\dashrightarrow} X^+ \wedge Y^+$$

given by

$$(-)^{+,-1}_{X,Y}(z) \overset{\text{def}}{=} \begin{cases} x \wedge y & \text{if } z = (x,y) \text{ with } (x,y) \in X \times Y, \\ \star_X \wedge \star_Y & \text{if } z = \star_{X\times Y}, \end{cases}$$

for each $z \in (X \times Y)^+$.

- *The Strong Monoidal Unity Constraint.* The isomorphism

$$(-)^{+,\mathbb{1}}_{X,Y} \colon S^0 \overset{\sim}{\dashrightarrow} \mathrm{pt}^+$$

is given by sending 0 to $\star_{\mathrm{pt}}$ and 1 to $\star$, where $\mathrm{pt}^+ = \{\star, \star_{\mathrm{pt}}\}$.

The verification that these isomorphisms satisfy the coherence conditions making the functor $(-)^+$ into a symmetric strong monoidal functor is omitted.

01QS 6.4.2 Deleting Basepoints

Let (X, x_0) be a pointed set.

01QT **Definition 6.4.2.1.1 ► Sets With Deleted Basepoints**

The **set with deleted basepoint associated to** X is the set X^- defined by

$$X^- \overset{\text{def}}{=} X \setminus \{x_0\}.$$

01QU **Proposition 6.4.2.1.2 ► Properties of Sets With Deleted Basepoints**

Let (X, x_0) be a pointed set.

01QV 1. *Functoriality.* The assignment $(X, x_0) \mapsto X^-$ defines a functor

$$X^- \colon \mathsf{Sets}_*^{\mathrm{actv}} \to \mathsf{Sets},$$

where:

- *Action on Objects.* For each $X \in \mathrm{Obj}(\mathsf{Sets}_*^{\mathrm{actv}})$, we have

$$[(-)^-](X) \stackrel{\text{def}}{=} X^-,$$

where X^- is the set of Definition 6.4.2.1.1.

- *Action on Morphisms.* For each morphism $f \colon X \to Y$ of $\mathsf{Sets}_*^{\mathrm{actv}}$, the image

$$f^- \colon X^- \to Y^-$$

of f by $(-)^-$ is the map defined by

$$f^-(x) \stackrel{\text{def}}{=} f(x)$$

for each $x \in X^-$.

01QW 2. *Adjoint Equivalence.* We have an adjoint equivalence of categories

$$\begin{tikzcd}((-)^- \dashv (-)^+)\colon \quad \mathsf{Sets}_*^{\mathrm{actv}} \arrow[r, bend left, "(-)^-"] \arrow[r, phantom, "\perp_{\mathrm{eq}}"] & \mathsf{Sets}, \arrow[l, bend left, "(-)^+"]\end{tikzcd}$$

witnessed by a bijection of sets

$$\mathsf{Sets}(X^-, Y) \cong \mathsf{Sets}_*(X, Y^+),$$

natural in $X \in \mathrm{Obj}(\mathsf{Sets}_*)$ and $Y \in \mathrm{Obj}(\mathsf{Sets})$, and by isomorphisms

$$(X^-)^+ \cong X,$$
$$(Y^+)^- \cong Y,$$

once again natural in $X \in \mathrm{Obj}(\mathsf{Sets}_*)$ and $Y \in \mathrm{Obj}(\mathsf{Sets})$.

01QX 3. *Symmetric Strong Monoidality With Respect to Wedge Sums.* The functor of Item 1 has a symmetric strong monoidal structure

$$((-)^-, (-)^{-,\vee}, (-)^{-,\vee}_{\mathbb{1}}) \colon (\mathsf{Sets}_*^{\mathrm{actv}}, \vee, \mathrm{pt}), \to (\mathsf{Sets}, \textstyle\coprod, \emptyset),$$

being equipped with isomorphisms of pointed sets

$$(-)^{-,\vee}_{X,Y} \colon X^- \textstyle\coprod Y^- \overset{\sim}{\dashrightarrow} (X \vee Y)^-,$$
$$(-)^{-,\vee}_{\mathbb{1}} \colon \emptyset \overset{\sim}{\dashrightarrow} \mathrm{pt}^-,$$

natural in $X, Y \in \mathrm{Obj}(\mathsf{Sets})$.

01QY 4. *Symmetric Strong Monoidality With Respect to Smash Products.* The free pointed set functor of Item 1 has a symmetric strong monoidal structure

$$((-)^{-}, (-)^{-,\times}, (-)^{-,\times}_{\mathbb{1}}) \colon (\mathsf{Sets}^{\mathrm{actv}}_{*}, \wedge, S^0), \to (\mathsf{Sets}, \times, \mathrm{pt})$$

being equipped with isomorphisms of pointed sets

$$(-)^{-}_{X,Y} \colon X^{-} \times Y^{-} \overset{\sim}{\dashrightarrow} (X \wedge Y)^{-},$$
$$(-)^{-}_{\mathbb{1}} \colon \mathrm{pt} \overset{\sim}{\dashrightarrow} (S^0)^{-},$$

natural in $X, Y \in \mathrm{Obj}(\mathsf{Sets})$.

Proof 6.4.2.1.3 ▶ Proof of Proposition 6.4.2.1.2

Item 1: Functoriality

We claim that $(-)^{-}$ is indeed a functor:

- *Preservation of Identities.* Let $X \in \mathrm{Obj}(\mathsf{Sets})$. We have

  $$\mathrm{id}^{-}_{X}(x) \overset{\mathrm{def}}{=} x$$

  for each $x \in X^{-}$, so $\mathrm{id}^{-}_{X} = \mathrm{id}_{X^{-}}$.

- *Preservation of Composition.* Given morphisms of pointed sets

  $$f \colon (X, x_0) \to (Y, y_0),$$
  $$g \colon (Y, y_0) \to (Z, z_0),$$

  we have

  $$\begin{aligned}[g^{-} \circ f^{-}](x) &\overset{\mathrm{def}}{=} g^{-}(f^{-}(x)) \\ &\overset{\mathrm{def}}{=} g^{-}(f(x)) \\ &\overset{\mathrm{def}}{=} g(f(x)) \\ &\overset{\mathrm{def}}{=} [g \circ f]^{-}(x)\end{aligned}$$

  for each $x \in X$, so $(g \circ f)^{-} = g^{-} \circ f^{-}$.

This finishes the proof.

Item 2: Adjoint Equivalence

We proceed in a few steps:

025H 1. *Map I.* We define a map

$$\Phi_{X,Y}\colon \mathsf{Sets}(X^-,Y) \to \mathsf{Sets}_*^{\mathrm{actv}}(X,Y^+)$$

by sending a map $\xi\colon X^- \to Y$ to the active morphism of pointed sets

$$\xi^\dagger\colon X \to Y^+$$

given by

$$\xi^\dagger(x) \overset{\mathrm{def}}{=} \begin{cases} \xi(x) & \text{if } x \in X^-, \\ \star_Y & \text{if } x = x_0, \end{cases}$$

for each $x \in X$, where this morphism is indeed active since $\xi(x) \in Y = Y^+ \setminus \{\star_Y\}$ for all $x \in X^-$.

025J 2. *Map II.* We define a map

$$\Psi_{X,Y}\colon \mathsf{Sets}_*^{\mathrm{actv}}(X,Y^+) \to \mathsf{Sets}(X^-,Y)$$

given by sending an active morphism of pointed sets $\xi\colon X \to Y^+$ to the map

$$\xi^\dagger\colon X^- \to Y$$

defined by

$$\xi^\dagger(x) \overset{\mathrm{def}}{=} \xi(x)$$

for each $x \in X^-$, which is indeed well-defined (in that $\xi(x) \in Y$ for all $x \in X^-$) since ξ is active.

025K 3. *Invertibility I.* Given a map of sets $\xi\colon X^- \to Y$, we have

$$\begin{aligned} [\Psi_{X,Y} \circ \Phi_{X,Y}](\xi) &\overset{\mathrm{def}}{=} \Psi_{X,Y}(\Phi_{X,Y}(\xi)) \\ &\overset{\mathrm{def}}{=} \Psi_{X,Y}\left(\left[\!\left[x \mapsto \begin{cases} \xi(x) & \text{if } x \in X^- \\ \star_Y & \text{if } x = x_0 \end{cases}\right]\!\right]\right) \\ &= [\![x \mapsto \xi(x)]\!] \end{aligned}$$

$$\begin{aligned} &= \xi \\ &= [\mathrm{id}_{\mathsf{Sets}(X^-,Y)}](\xi). \end{aligned}$$

Therefore we have

$$\Psi_{X,Y} \circ \Phi_{X,Y} = \mathrm{id}_{\mathsf{Sets}(X^-,Y)}\,.$$

025L

4. *Invertibility II.* Given a morphism of pointed sets

$$\xi \colon (X, x_0) \to (Y^+, \star_Y),$$

we have

$$\begin{aligned} [\Phi_{X,Y} \circ \Psi_{X,Y}](\xi) &\overset{\text{def}}{=} \Phi_{X,Y}(\Psi_{X,Y}(\xi)) \\ &= \Phi_{X,Y}([\![x \mapsto \xi(x)]\!]) \\ &= [\![x \mapsto \begin{cases} \xi(x) & \text{if } x \in X^- \\ \star_Y & \text{if } x = x_0 \end{cases}]\!] \\ &= \xi \\ &= [\mathrm{id}_{\mathsf{Sets}_*^{\mathrm{actv}}(X,Y^+)}](\xi). \end{aligned}$$

Therefore we have

$$\Phi_{X,Y} \circ \Psi_{X,Y} = \mathrm{id}_{\mathsf{Sets}_*^{\mathrm{actv}}(X,Y^+)}\,.$$

025M

5. *Naturality for Φ, Part I.* We need to show that, given a morphism of pointed sets

$$f \colon (X, x_0) \to (X', x_0'),$$

the diagram

$$\begin{tikzcd} \mathsf{Sets}(X'^{,-}, Y) \arrow[r, "\Phi_{X',Y}"] \arrow[d, "f^*"'] & \mathsf{Sets}_*^{\mathrm{actv}}(X', Y^+) \arrow[d, "f^*"] \\ \mathsf{Sets}_*(X^-, Y) \arrow[r, "\Phi_{X,Y}"'] & \mathsf{Sets}_*^{\mathrm{actv}}(X, Y^+) \end{tikzcd}$$

commutes. Indeed, given a map of sets $\xi \colon X' \to Y$, we have

$$[\Phi_{X,Y} \circ f^*](\xi) = \Phi_{X,Y}(f^*(\xi))$$

$$
\begin{aligned}
&= \Phi_{X,Y}(\xi \circ f) \\
&= [\![x \mapsto \begin{cases} \xi(f(x)) & \text{if } f(x) \in X'^{,-} \\ \star_Y & \text{if } f(x) = x'_0 \end{cases}]\!] \\
&= f^*([\![x' \mapsto \begin{cases} \xi(x') & \text{if } x' \in X'^{,-} \\ \star_Y & \text{if } x' = x'_0 \end{cases}]\!]) \\
&= f^*(\Phi_{X',Y}(\xi)) \\
&= [f^* \circ \Phi_{X',Y}](\xi).
\end{aligned}
$$

Therefore we have

$$\Phi_{X,Y} \circ f^* = f^* \circ \Phi_{X',Y},$$

and the naturality diagram for Φ above indeed commutes.

025N 6. *Naturality for Φ, Part II.* We need to show that, given a morphism of pointed sets

$$g\colon (Y, y_0) \to (Y', y'_0),$$

the diagram

$$
\begin{tikzcd}
\mathsf{Sets}(X^-, Y) \arrow[r, "\Phi_{X,Y}"] \arrow[d, "g_*"'] & \mathsf{Sets}_*^{\mathrm{actv}}(X, Y^+) \arrow[d, "g_*"] \\
\mathsf{Sets}(X^-, Y') \arrow[r, "\Phi_{X,Y'}"'] & \mathsf{Sets}_*^{\mathrm{actv}}(X, Y'^{,+})
\end{tikzcd}
$$

commutes. Indeed, given a map of sets $\xi\colon X^- \to Y$, we have

$$
\begin{aligned}
[\Phi_{X,Y'} \circ g_*](\xi) &= \Phi_{X,Y'}(g_*(\xi)) \\
&= \Phi_{X,Y'}(g \circ \xi) \\
&= [\![x \mapsto \begin{cases} g(\xi(x)) & \text{if } x \in X^- \\ \star_{Y'} & \text{if } x = x_0 \end{cases}]\!] \\
&= g_*([\![x \mapsto \begin{cases} \xi(x) & \text{if } x \in X^- \\ \star_Y & \text{if } x = x_0 \end{cases}]\!]) \\
&= g_*(\Phi_{X,Y'}(\xi))
\end{aligned}
$$

$$= [g_* \circ \Phi_{X,Y'}](\xi).$$

Therefore we have

$$\Phi_{X,Y'} \circ g_* = g_* \circ \Phi_{X,Y'},$$

and the naturality diagram for Φ above indeed commutes.

025P 7. *Naturality for* Ψ. Since Φ is natural in each argument and Φ is a componentwise inverse to Ψ in each argument, it follows from Categories, Item 2 of Proposition 11.9.7.1.2 that Ψ is also natural in each argument.

025Q 8. *Fully Faithfulness of* $(-)^{-}$. We aim to show that the assignment $f \mapsto f^{-}$ sets up a bijection

$$(-)^{-}_{X,Y} : \mathsf{Sets}^{\mathrm{actv}}_{*}(X,Y) \xrightarrow{\sim} \mathsf{Sets}(X^{-},Y^{-}).$$

Indeed, the inverse map

$$(-)^{-,-1}_{X,Y} : \mathsf{Sets}(X^{-},Y^{-}) \xrightarrow{\sim} \mathsf{Sets}^{\mathrm{actv}}_{*}(X,Y)$$

is given by sending a map of sets $f : X^{-} \to Y^{-}$ to the active morphism of pointed sets $f^{\dagger} : X \to Y$ defined by

$$f^{\dagger}(x) \overset{\mathrm{def}}{=} \begin{cases} f(x) & \text{if } x \in X^{-}, \\ y_0 & \text{if } x = x_0 \end{cases}$$

for each $x \in X$.

025R 9. *Essential Surjectivity of* $(-)^{-}$. We need to show that, given an object $X \in \mathrm{Obj}(\mathsf{Sets})$, there exists some $X' \in \mathrm{Obj}(\mathsf{Sets}^{\mathrm{actv}}_{*})$ such that $(X')^{-} \cong X$. Indeed, taking $X' = X^{+}$, we have

$$\begin{aligned} (X^{+})^{-} &\overset{\mathrm{def}}{=} (X \cup \{\star_X\})^{-} \\ &\overset{\mathrm{def}}{=} (X \cup \{\star_X\}) \setminus \{\star_X\} \\ &= X, \end{aligned}$$

and thus we have in fact an *equality* $(X^{+})^{-} = X$, showing $(-)^{-}$ to be essentially surjective.

025S 10. *The Functor $(-)^{-}$ Is an Equivalence.* Since $(-)^{-}$ is fully faithful and essentially surjective, it is an equivalence by Categories, Item 1 of Proposition 11.6.7.1.2.

This finishes the proof.

Item 3: Symmetric Strong Monoidality With Respect to Wedge Sums

We construct the strong monoidal structure on $(-)^{-}$ with respect to $\vee$ and $\coprod$ as follows:

- *The Strong Monoidality Constraints.* The isomorphism

$$(-)^{-,\vee}_{X,Y} \colon X^{-} \coprod Y^{-} \overset{\sim}{\dashrightarrow} (X \vee Y)^{-}$$

is given by

$$(-)^{-,\vee}_{X,Y}(z) = \begin{cases} [(0,x)] & \text{if } z = (0,x) \text{ with } x \in X, \\ [(1,y)] & \text{if } z = (1,y) \text{ with } y \in Y \end{cases}$$

for each $z \in X^{-} \coprod Y^{-}$, with inverse

$$(-)^{-,\vee,-1}_{X,Y} \colon (X \vee Y)^{-} \overset{\sim}{\dashrightarrow} X^{-} \coprod Y^{-}$$

given by

$$(-)^{-,\vee,-1}_{X,Y}(z) \overset{\text{def}}{=} \begin{cases} (0,x) & \text{if } z = [(0,x)], \\ (1,y) & \text{if } z = [(1,y)], \end{cases}$$

for each $z \in (X \vee Y)^{-}$.

- *The Strong Monoidal Unity Constraint.* The isomorphism

$$(-)^{+,\vee,\mathbb{1}}_{X,Y} \colon \emptyset \overset{\sim}{\dashrightarrow} \mathrm{pt}^{-}$$

is an equality.

The verification that these isomorphisms satisfy the coherence conditions making the functor $(-)^{-}$ into a symmetric strong monoidal functor is omitted.

Item 4: Symmetric Strong Monoidality With Respect to Smash Products

We construct the strong monoidal structure on $(-)^{+}$ with respect to $\wedge$ and $\times$ as follows:

- *The Strong Monoidality Constraints.* The isomorphism

$$(-)^{-}_{X,Y} \colon X^{-} \times Y^{-} \overset{\sim}{\dashrightarrow} (X \wedge Y)^{-}$$

is given by

$$(-)^{-}_{X,Y}(x,y) = x \wedge y$$

for each $(x,y) \in X^{-} \times Y^{-}$, with inverse

$$(-)^{-,-1}_{X,Y} \colon (X \wedge Y)^{-} \overset{\sim}{\dashrightarrow} X^{-} \times Y^{-}$$

given by

$$(-)^{-,-1}_{X,Y}(x \wedge y) \overset{\text{def}}{=} (x,y)$$

for each $x \wedge y \in (X \wedge Y)^{-}$.

- *The Strong Monoidal Unity Constraint.* The isomorphism

$$(-)^{-,\mathbb{1}}_{X,Y} \colon \mathrm{pt} \overset{\sim}{\dashrightarrow} (S^0)^{-}$$

is given by sending $\star$ to 1.

The verification that these isomorphisms satisfy the coherence conditions making the functor $(-)^{+}$ into a symmetric strong monoidal functor is omitted.
