Constructions With Relations

The Clowder Project Authors

July 29, 2025

This chapter contains some material about constructions with relations. Notably, we discuss and explore:

- I. The existence or non-existence of Kan extensions and Kan lifts in the 2-category **Rel** (??).
- 2. The various kinds of constructions involving relations, such as graphs, domains, ranges, unions, intersections, products, converse relations, composition of relations, and collages (Section 9.2).

This chapter is under revision. TODO:

- 1. Rename range to image
- 2. Co/limits in Rel.

9.1 Co/Limits in the Category of Relations

This section is currently just a stub, and will be properly developed later on.

9.2 More Constructions With Relations

9.2.1 The Domain and Range of a Relation

Let A and B be sets.

Definition 9.2.1.1.1. Let $R: A \rightarrow B$ be a relation.^{1,2}

$$\chi_{\text{dom}(R)}(a) \cong \underset{b \in B}{\text{colim}}(R_a^b) \qquad (a \in A)$$

$$\cong \bigvee_{b \in B} R_{a^b}^b$$

$$\chi_{\text{range}(R)}(b) \cong \underset{a \in A}{\text{colim}}(R_a^b) \qquad (b \in B)$$

$$\cong \bigvee_{a \in A} R_{a^b}^b,$$

where the join \bigvee is taken in the poset ({true, false}, \preceq) of Constructions With Sets, Definition 3.2.2.1.3.

²Viewing *R* as a function $R: A \to \mathcal{P}(B)$, we have

$$\operatorname{dom}(R) \cong \underset{y \in Y}{\operatorname{colim}}(R(y))$$

$$\cong \bigcup_{y \in Y} R(y),$$

$$\operatorname{range}(R) \cong \underset{x \in X}{\operatorname{colim}}(R(x))$$

$$\cong \bigcup_{x \in X} R(x),$$

¹Following ??, ??, we may compute the (characteristic functions associated to the) domain and range of a relation using the following colimit formulas:

I. The **domain of** R is the subset dom(R) of A defined by

$$\operatorname{dom}(R) \stackrel{\text{def}}{=} \left\{ a \in A \middle| \begin{array}{l} \text{there exists some } b \in B \\ \text{such that } a \sim_R b \end{array} \right\}.$$

2. The **range of** R is the subset range(R) of B defined by

range
$$(R) \stackrel{\text{def}}{=} \left\{ b \in B \middle| \text{ there exists some } a \in A \right\}$$
.

9.2.2 Binary Unions of Relations

Let A and B be sets and let R and S be relations from A to B.

Definition 9.2.2.1.1. The **union of** R **and** S^3 is the relation $R \cup S$ from A to B defined as follows:

• Viewing relations from A to B as subsets of $A \times B$, we define

$$R \cup S \stackrel{\text{def}}{=} \{(a, b) \in B \times A \mid \text{we have } a \sim_R b \text{ or } a \sim_S b\}.$$

• Viewing relations from A to B as functions $A \to \mathcal{P}(B)$, we define

$$[R \cup S](a) \stackrel{\text{def}}{=} R(a) \cup S(a)$$

for each $a \in A$.

Proposition 9.2.2.1.2. Let R, S, R_1 , and R_2 be relations from A to B, and let S_1 and S_2 be relations from B to C.

I. Interaction With Converses. We have

$$(R \cup S)^{\dagger} = R^{\dagger} \cup S^{\dagger}.$$

2. Interaction With Composition. We have

$$(S_1 \diamond R_1) \cup (S_2 \diamond R_2) \stackrel{\text{poss.}}{\neq} (S_1 \cup S_2) \diamond (R_1 \cup R_2).$$

³ Further Terminology: Also called the **binary union of** R **and** S, for emphasis.

⁴This is the same as the union of R and S as subsets of $A \times B$.

Proof. Item 1, *Interaction With Converses*: Clear. *Item 2*, *Interaction With Composition*: Unwinding the definitions, we see that:

- The condition for $(S_1 \diamond R_1) \cup (S_2 \diamond R_2)$ is:
 - There exists some $b \in B$ such that:
 - * $a \sim_{R_1} b$ and $b \sim_{S_1} c$;

or

- * $a \sim_{R_2} b$ and $b \sim_{S_2} c$;
- The condition for $(S_1 \cup S_2) \diamond (R_1 \cup R_2)$ is:
 - There exists some $b \in B$ such that:

*
$$a \sim_{R_1} b$$
 or $a \sim_{R_2} b$;

and

*
$$b \sim_{S_1} c$$
 or $b \sim_{S_2} c$.

These two conditions may fail to agree (counterexample omitted), and thus the two resulting relations on $A \times C$ may differ.

9.2.3 Unions of Families of Relations

Let A and B be sets and let $\{R_i\}_{i\in I}$ be a family of relations from A to B.

Definition 9.2.3.1.1. The union of the family $\{R_i\}_{i\in I}$ is the relation $\bigcup_{i\in I} R_i$ from A to B defined as follows:

• Viewing relations from A to B as subsets of $A \times B$, we define

$$\bigcup_{i \in I} R_i \stackrel{\text{def}}{=} \left\{ (a, b) \in (A \times B)^{\times I} \middle| \begin{array}{l} \text{there exists some } i \in I \\ \text{such that } a \sim_{R_i} b \end{array} \right\}.$$

• Viewing relations from A to B as functions $A \to \mathcal{P}(B)$, we define

$$\left[\bigcup_{i\in I} R_i\right](a) \stackrel{\text{def}}{=} \bigcup_{i\in I} R_i(a)$$

for each $a \in A$.

⁵This is the same as the union of $\{R_i\}_{i\in I}$ as a collection of subsets of $A\times B$.

Proposition 9.2.3.1.2. Let A and B be sets and let $\{R_i\}_{i\in I}$ be a family of relations from A to B.

I. Interaction With Converses. We have

$$\left(\bigcup_{i\in I}R_i\right)^{\dagger}=\bigcup_{i\in I}R_i^{\dagger}.$$

Proof. Item 1, Interaction With Converses: Clear.

9.2.4 Binary Intersections of Relations

Let A and B be sets and let R and S be relations from A to B.

Definition 9.2.4.1.1. The **intersection of** R **and** S^6 is the relation $R \cap S$ from A to B defined as follows:

• Viewing relations from A to B as subsets of $A \times B$, we define⁷

$$R \cap S \stackrel{\text{def}}{=} \{(a, b) \in B \times A \mid \text{we have } a \sim_R b \text{ and } a \sim_S b\}.$$

• Viewing relations from A to B as functions $A \to \mathcal{P}(B)$, we define

$$[R \cap S](a) \stackrel{\text{def}}{=} R(a) \cap S(a)$$

for each $a \in A$.

Proposition 9.2.4.1.2. Let R, S, R_1 , and R_2 be relations from A to B, and let S_1 and S_2 be relations from B to C.

I. Interaction With Converses. We have

$$(R \cap S)^{\dagger} = R^{\dagger} \cap S^{\dagger}.$$

2. Interaction With Composition. We have

$$(S_1 \diamond R_1) \cap (S_2 \diamond R_2) = (S_1 \cap S_2) \diamond (R_1 \cap R_2).$$

⁶ Further Terminology: Also called the **binary intersection of** R **and** S, for emphasis.

⁷This is the same as the intersection of R and S as subsets of $A \times B$.

Proof. Item 1, *Interaction With Converses*: Clear. *Item 2*, *Interaction With Composition*: Unwinding the definitions, we see that:

- The condition for $(S_1 \diamond R_1) \cap (S_2 \diamond R_2)$ is:
 - There exists some $b \in B$ such that:
 - * $a \sim_{R_1} b$ and $b \sim_{S_1} c$;

and

- * $a \sim_{R_2} b$ and $b \sim_{S_2} c$;
- The condition for $(S_1 \cap S_2) \diamond (R_1 \cap R_2)$ is:
 - There exists some $b \in B$ such that:

*
$$a \sim_{R_1} b$$
 and $a \sim_{R_2} b$;

and

* $b \sim_{S_1} c$ and $b \sim_{S_2} c$.

These two conditions agree, and thus so do the two resulting relations on $A \times C$.

9.2.5 Intersections of Families of Relations

Let A and B be sets and let $\{R_i\}_{i\in I}$ be a family of relations from A to B.

Definition 9.2.5.1.1. The intersection of the family $\{R_i\}_{i\in I}$ is the relation $\bigcup_{i\in I} R_i$ defined as follows:

• Viewing relations from A to B as subsets of $A \times B$, we define⁸

$$\bigcup_{i \in I} R_i \stackrel{\text{def}}{=} \left\{ (a, b) \in (A \times B)^{\times I} \middle| \begin{array}{l} \text{for each } i \in I, \\ \text{we have } a \sim_{R_i} b \end{array} \right\}.$$

• Viewing relations from A to B as functions $A \to \mathcal{P}(B)$, we define

$$\left[\bigcap_{i\in I} R_i\right](a) \stackrel{\text{def}}{=} \bigcap_{i\in I} R_i(a)$$

for each $a \in A$.

⁸This is the same as the intersection of $\{R_i\}_{i\in I}$ as a collection of subsets of $A\times B$.

Proposition 9.2.5.1.2. Let A and B be sets and let $\{R_i\}_{i\in I}$ be a family of relations from A to B.

I. Interaction With Converses. We have

$$\left(\bigcap_{i\in I}R_i\right)^{\dagger}=\bigcap_{i\in I}R_i^{\dagger}.$$

Proof. Item 1, Interaction With Converses: Clear.

9.2.6 Binary Products of Relations

Let A, B, X, and Y be sets, let $R: A \rightarrow B$ be a relation from A to B, and let $S: X \rightarrow Y$ be a relation from X to Y.

Definition 9.2.6.1.1. The **product of** R **and** S⁹ is the relation $R \times S$ from $A \times X$ to $B \times Y$ defined as follows:

- Viewing relations from $A \times X$ to $B \times Y$ as subsets of $(A \times X) \times (B \times Y)$, we define $R \times S$ as the Cartesian product of R and S as subsets of $A \times X$ and $B \times Y$. To
- Viewing relations from $A \times X$ to $B \times Y$ as functions $A \times X \to \mathcal{P}(B \times Y)$, we define $R \times S$ as the composition

$$A \times X \xrightarrow{R \times S} \mathcal{P}(B) \times \mathcal{P}(Y) \xrightarrow{\mathcal{P}_{B,Y}^{\otimes}} \mathcal{P}(B \times Y)$$

in Sets, i.e. by

$$[R \times S](a, x) \stackrel{\text{def}}{=} R(a) \times S(x)$$

for each $(a, x) \in A \times X$.

Proposition 9.2.6.1.2. Let A, B, X, and Y be sets.

1. Interaction With Converses. Let

$$R: A \to A,$$
$$S: X \to X$$

We have

$$(R \times S)^{\dagger} = R^{\dagger} \times S^{\dagger}.$$

⁹ Further Terminology: Also called the **binary product of** R **and** S, for emphasis.

¹⁰That is, $R \times S$ is the relation given by declaring $(a, x) \sim_{R \times S} (b, y)$ iff $a \sim_R b$ and $x \sim_S y$.

2. Interaction With Composition. Let

$$R_1: A \rightarrow B$$
,
 $S_1: B \rightarrow C$,
 $R_2: X \rightarrow Y$,
 $S_2: Y \rightarrow Z$

be relations. We have

$$(S_1 \diamond R_1) \times (S_2 \diamond R_2) = (S_1 \times S_2) \diamond (R_1 \times R_2).$$

Proof. Item 1, *Interaction With Converses*: Unwinding the definitions, we see that:

- We have $(a, x) \sim_{(R \times S)^{\dagger}} (b, y)$ iff:
 - We have $(b, y) \sim_{R \times S} (a, x)$, i.e. iff:
 - * We have $b \sim_R a$;
 - * We have $y \sim_S x$;
- We have $(a, x) \sim_{R^{\dagger} \times S^{\dagger}} (b, y)$ iff:
 - We have $a \sim_{R^{\dagger}} b$ and $x \sim_{S^{\dagger}} y$, i.e. iff:
 - * We have $b \sim_R a$;
 - * We have $y \sim_S x$.

These two conditions agree, and thus the two resulting relations on $A \times X$ are equal.

Item 2, Interaction With Composition: Unwinding the definitions, we see that:

- We have $(a, x) \sim_{(S_1 \diamond R_1) \times (S_2 \diamond R_2)} (c, z)$ iff:
 - We have $a \sim_{S_1 \diamond R_1} c$ and $x \sim_{S_2 \diamond R_2} z$, i.e. iff:
 - * There exists some $b \in B$ such that $a \sim_{R_1} b$ and $b \sim_{S_1} c$;
 - * There exists some $y \in Y$ such that $x \sim_{R_2} y$ and $y \sim_{S_2} z$;
- We have $(a, x) \sim_{(S_1 \times S_2) \diamond (R_1 \times R_2)} (c, z)$ iff:

- There exists some $(b, y) \in B \times Y$ such that $(a, x) \sim_{R_1 \times R_2} (b, y)$ and $(b, y) \sim_{S_1 \times S_2} (c, z)$, i.e. such that:
 - * We have $a \sim_{R_1} b$ and $x \sim_{R_2} y$;
 - * We have $b \sim_{S_1} c$ and $y \sim_{S_2} z$.

These two conditions agree, and thus the two resulting relations from $A \times X$ to $C \times Z$ are equal.

9.2.7 Products of Families of Relations

Let $\{A_i\}_{i\in I}$ and $\{B_i\}_{i\in I}$ be families of sets, and let $\{R_i\colon A_i\to B_i\}_{i\in I}$ be a family of relations.

Definition 9.2.7.1.1. The **product of the family** $\{R_i\}_{i\in I}$ is the relation $\prod_{i\in I} R_i$ from $\prod_{i\in I} A_i$ to $\prod_{i\in I} B_i$ defined as follows:

• Viewing relations as subsets, we define $\prod_{i \in I} R_i$ as its product as a family of sets, i.e. we have

$$\prod_{i \in I} R_i \stackrel{\text{def}}{=} \left\{ (a_i, b_i)_{i \in I} \in \prod_{i \in I} (A_i \times B_i) \middle| \begin{array}{l} \text{for each } i \in I, \\ \text{we have } a_i \sim_{R_i} b_i \end{array} \right\}.$$

Viewing relations as functions to powersets, we define

$$\left[\prod_{i\in I} R_i\right]((a_i)_{i\in I}) \stackrel{\text{def}}{=} \prod_{i\in I} R_i(a_i)$$

for each $(a_i)_{i \in I} \in \prod_{i \in I} R_i$.

9.2.8 The Collage of a Relation

Let A and B be sets and let $R: A \rightarrow B$ be a relation from A to B.

Definition 9.2.8.1.1. The **collage of** R^{Π} is the poset **Coll** $(R) \stackrel{\text{def}}{=} (\text{Coll}(R), \preceq_{\text{Coll}(R)})$ consisting of:

^{II} Further Terminology: Also called the **cograph of** R.

• *The Underlying Set.* The set Coll(*R*) defined by

$$Coll(R) \stackrel{\text{def}}{=} A \coprod B$$
.

• The Partial Order. The partial order

$$\leq_{\mathbf{Coll}(R)} : \mathrm{Coll}(R) \times \mathrm{Coll}(R) \rightarrow \{\mathsf{true}, \mathsf{false}\}$$

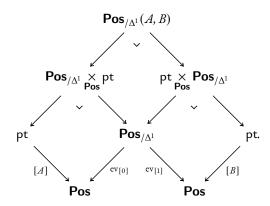

on Coll(*R*) defined by

$$\preceq (a, b) \stackrel{\text{def}}{=} \begin{cases} \text{true} & \text{if } a = b \text{ or } a \sim_R b, \\ \text{false} & \text{otherwise.} \end{cases}$$

Notation 9.2.8.1.2. We write $\mathsf{Pos}_{/\Delta^1}(A,B)$ for the category defined as the pullback

$$\mathsf{Pos}_{/\Delta^1}(A, B) \stackrel{\mathsf{def}}{=} \mathsf{pt} \underset{[A], \mathsf{Pos}, \mathsf{ev}_0}{\times} \mathsf{Pos}_{/\Delta^1} \underset{\mathsf{ev}_1, \mathsf{Pos}, [B]}{\times} \mathsf{pt},$$

as in the diagram

Remark 9.2.8.1.3. In detail, $Pos_{/\Delta^1}(A, B)$ is the category where:

- Objects. An object of $\mathsf{Pos}_{/\Delta^1}(A,B)$ is a pair (X,ϕ_X) consisting of
 - A poset X;
 - A morphism $\phi_X : X \to \Delta^1$;

such that we have

$$\phi_X^{-1}(0) = A,$$

$$\phi_X^{-1}(1) = B.$$

• *Morphisms*. A morphism of $\mathsf{Pos}_{/\Delta^1}(A,B)$ from (X,ϕ_X) to (Y,ϕ_Y) is a morphism of posets $f:X\to Y$ making the diagram

$$X \xrightarrow{f} Y$$

$$A^{1} \qquad \qquad A^{1}$$

commute.

Proposition 9.2.8.1.4. Let A and B be sets and let $R: A \rightarrow B$ be a relation from A to B.

1. *Functoriality*. The assignment $R \mapsto \mathbf{Coll}(R)$ defines a functor

Coll: Rel
$$(A, B) \rightarrow \mathsf{Pos}_{/\Delta^1}(A, B)$$
,

where

• Action on Objects. For each $R \in \text{Obj}(\mathbf{Rel}(A, B))$, we have

$$[Coll](R) \stackrel{\text{def}}{=} (Coll(R), \phi_R)$$

for each $R \in \mathbf{Rel}(A, B)$, where

- The poset Coll(R) is the collage of R of Definition 9.2.8.1.1.
- The morphism $\phi_R \colon \mathbf{Coll}(R) \to \Delta^1$ is given by

$$\phi_R(x) \stackrel{\text{def}}{=} \begin{cases} 0 & \text{if } x \in A, \\ 1 & \text{if } x \in B \end{cases}$$

for each $x \in \mathbf{Coll}(R)$.

 Action on Morphisms. For each R, S ∈ Obj(Rel(A, B)), the action on Hom-sets

$$\mathbf{Coll}_{R,S} \colon \mathbf{Hom}_{\mathbf{Rel}(A,B)}(R,S) \to \mathsf{Pos}(\mathbf{Coll}(R),\mathbf{Coll}(S))$$

of **Coll** at (R, S) is given by sending an inclusion

$$\iota \colon R \subset S$$

to the morphism

$$Coll(\iota) : Coll(R) \rightarrow Coll(S)$$

of posets over Δ^1 defined by

$$[\mathbf{Coll}(\iota)](x) \stackrel{\text{def}}{=} x$$

for each $x \in \mathbf{Coll}(R)$.¹²

2. *Equivalence*. The functor of Item 1 is an equivalence of categories.

Proof. Item 1, Functoriality: Clear. Item 2, Equivalence: Omitted.
