# 10.1 Functional and Total Relations

### 10.1.1 Functional Relations

Let A and B be sets.

**Definition 10.1.1.1.1.** A relation  $R: A \rightarrow B$  is **functional** if, for each  $a \in A$ , the set R(a) is either empty or a singleton.

**Proposition 10.1.1.1.2.** Let  $R: A \rightarrow B$  be a relation.

- 1. Characterisations. The following conditions are equivalent:
  - (a) The relation *R* is functional.
  - (b) We have  $R \diamond R^{\dagger} \subset \chi_B$ .

*Proof. Item* 1, *Characterisations*: We claim that Items 1a and 1b are indeed equivalent:

· Item 1a  $\Longrightarrow$  Item 1b: Let  $(b, b') \in B \times B$ . We need to show that

$$[R \diamond R^{\dagger}](b,b') \preceq_{\{\mathsf{t},\mathsf{f}\}} \chi_B(b,b'),$$

i.e. that if there exists some  $a \in A$  such that  $b \sim_{R^{\dagger}} a$  and  $a \sim_{R} b'$ , then b = b'. But since  $b \sim_{R^{\dagger}} a$  is the same as  $a \sim_{R} b$ , we have both  $a \sim_{R} b$  and  $a \sim_{R} b'$  at the same time, which implies b = b' since R is functional.

- · Item 1b  $\Longrightarrow$  Item 1a: Suppose that we have  $a \sim_R b$  and  $a \sim_R b'$  for  $b, b' \in B$ . We claim that b = b':
  - Since  $a \sim_R b$ , we have  $b \sim_{R^{\dagger}} a$ .
  - Since  $R \diamond R^{\dagger} \subset \chi_B$ , we have

$$[R \diamond R^{\dagger}](b,b') \preceq_{\{\mathsf{t},\mathsf{f}\}} \chi_B(b,b'),$$

and since  $b \sim_{R^{\dagger}} a$  and  $a \sim_{R} b'$ , it follows that  $\left[R \diamond R^{\dagger}\right](b,b') = \text{true}$ , and thus  $\chi_{B}(b,b') = \text{true}$  as well, i.e. b = b'.

This finishes the proof.

10.1.2 Total Relations 3

### 10.1.2 Total Relations

Let A and B be sets.

**Definition 10.1.2.1.1.** A relation  $R: A \rightarrow B$  is **total** if, for each  $a \in A$ , we have  $R(a) \neq \emptyset$ .

**Proposition 10.1.2.1.2.** Let  $R: A \rightarrow B$  be a relation.

- 1. Characterisations. The following conditions are equivalent:
  - (a) The relation R is total.
  - (b) We have  $\chi_A \subset R^{\dagger} \diamond R$ .

*Proof.* Item 1, Characterisations: We claim that Items 1a and 1b are indeed equivalent:

· Item 1a  $\Longrightarrow$  Item 1b: We have to show that, for each  $(a, a') \in A$ , we have

$$\chi_A(a,a') \preceq_{\{\mathsf{t},\mathsf{f}\}} \left[ R^{\dagger} \diamond R \right] (a,a'),$$

i.e. that if a=a', then there exists some  $b\in B$  such that  $a\sim_R b$  and  $b\sim_{R^\dagger} a'$  (i.e.  $a\sim_R b$  again), which follows from the totality of R.

· Item 1b  $\Longrightarrow$  Item 1a: Given  $a \in A$ , since  $\chi_A \subset R^{\dagger} \diamond R$ , we must have

$${a} \subset [R^{\dagger} \diamond R](a),$$

implying that there must exist some  $b \in B$  such that  $a \sim_R b$  and  $b \sim_{R^{\dagger}} a$  (i.e.  $a \sim_R b$ ) and thus  $R(a) \neq \emptyset$ , as  $b \in R(a)$ .

This finishes the proof.

## 10.2 Reflexive Relations

#### 10.2.1 Foundations

Let A be a set.

**Definition 10.2.1.1.1.** A **reflexive relation** is equivalently:

 $<sup>^{1}</sup>$ Note that since  $\mathbf{Rel}(A,A)$  is posetal, reflexivity is a property of a relation, rather than extra structure.

- · An  $\mathbb{E}_0$ -monoid in  $(N_{\bullet}(\text{Rel}(A, A)), \gamma_A)$ .
- · A pointed object in ( $Rel(A, A), \gamma_A$ ).

**Remark 10.2.1.1.2.** In detail, a relation *R* on *A* is **reflexive** if we have an inclusion

$$\eta_R \colon \chi_A \subset R$$

of relations in  $\operatorname{Rel}(A, A)$ , i.e. if, for each  $a \in A$ , we have  $a \sim_R a$ .

**Definition 10.2.1.1.3.** Let *A* be a set.

- 1. The **set of reflexive relations on** A is the subset  $Rel^{refl}(A, A)$  of Rel(A, A) spanned by the reflexive relations.
- 2. The **poset of relations on** A is is the subposet  $Rel^{refl}(A, A)$  of Rel(A, A) spanned by the reflexive relations.

**Proposition 10.2.1.1.4.** Let R and S be relations on A.

- 1. *Interaction With Inverses.* If R is reflexive, then so is  $R^{\dagger}$ .
- 2. *Interaction With Composition.* If R and S are reflexive, then so is  $S \diamond R$ .

Proof. Item 1, Interaction With Inverses: Clear. Item 2, Interaction With Composition: Clear.

### 10.2.2 The Reflexive Closure of a Relation

Let R be a relation on A.

**Definition 10.2.2.1.1.** The **reflexive closure** of  $\sim_R$  is the relation  $\sim_R^{\text{refl}_2}$  satisfying the following universal property:<sup>3</sup>

 $(\star)$  Given another reflexive relation  $\sim_S$  on A such that  $R \subset S$ , there exists an inclusion  $\sim_R^{\mathsf{refl}} \subset \sim_S$ .

**Construction 10.2.2.1.2.** Concretely,  $\sim_R^{\text{refl}}$  is the free pointed object on R in  $(\text{Rel}(A, A), \chi_A)^4$ ,

<sup>&</sup>lt;sup>2</sup> Further Notation: Also written  $R^{\text{refl}}$ .

<sup>&</sup>lt;sup>3</sup> Slogan: The reflexive closure of R is the smallest reflexive relation containing R.

<sup>&</sup>lt;sup>4</sup>Or, equivalently, the free  $\mathbb{E}_0$ -monoid on R in  $(N_{\bullet}(\mathbf{Rel}(A, A)), \chi_A)$ .

being given by

$$R^{\mathrm{refl}} \stackrel{\mathrm{def}}{=} R \coprod^{\mathrm{Rel}(A,A)} \Delta_A$$
  
=  $R \cup \Delta_A$   
=  $\{(a,b) \in A \times A \mid \text{we have } a \sim_R b \text{ or } a = b\}.$ 

Proof. Clear.

**Proposition 10.2.2.1.3.** Let R be a relation on A.

1. Adjointness. We have an adjunction

$$\left((-)^{\text{refl}} \dashv \stackrel{\leftarrow}{\sim}\right): \quad \text{Rel}(A, A) \underbrace{\stackrel{(-)^{\text{refl}}}{\stackrel{\leftarrow}{\sim}}}_{\stackrel{\leftarrow}{\sim}} \text{Rel}^{\text{refl}}(A, A),$$

witnessed by a bijection of sets

$$\mathbf{Rel}^{\mathsf{refl}}(R^{\mathsf{refl}}, S) \cong \mathbf{Rel}(R, S),$$

natural in  $R \in \text{Obj}(\mathbf{Rel}^{\text{refl}}(A, A))$  and  $S \in \text{Obj}(\mathbf{Rel}(A, A))$ .

- 2. The Reflexive Closure of a Reflexive Relation. If R is reflexive, then  $R^{\text{refl}} = R$ .
- 3. Idempotency. We have

$$\left(R^{\text{refl}}\right)^{\text{refl}} = R^{\text{refl}}.$$

4. Interaction With Inverses. We have

$$(R^{\dagger})^{\text{refl}} = (R^{\text{refl}})^{\dagger}, \qquad (-)^{\dagger} \downarrow \qquad \qquad \downarrow^{(-)^{\dagger}}$$

$$\text{Rel}(A, A) \xrightarrow{(-)^{\text{refl}}} \text{Rel}(A, A).$$

$$\text{Rel}(A, A) \xrightarrow{(-)^{\text{refl}}} \text{Rel}(A, A).$$

5. Interaction With Composition. We have

$$(S \diamond R)^{\mathsf{refl}} = S^{\mathsf{refl}} \diamond R^{\mathsf{refl}}, \qquad (-)^{\mathsf{refl}} \times (-)^{\mathsf{refl}} \downarrow \qquad \qquad \downarrow (-)^{\mathsf{refl}}$$

$$\mathsf{Rel}(A, A) \times \mathsf{Rel}(A, A) \xrightarrow{\diamond} \mathsf{Rel}(A, A).$$

*Proof. Item* 1, *Adjointness*: This is a rephrasing of the universal property of the reflexive closure of a relation, stated in Definition 10.2.2.1.1.

Item 2, The Reflexive Closure of a Reflexive Relation: Clear.

Item 3, Idempotency: This follows from Item 2.

Item 4, Interaction With Inverses: Clear.

Item 5, Interaction With Composition: This follows from Item 2 of Definition 10.2.1.1.4.

# 10.3 Symmetric Relations

### 10.3.1 Foundations

Let *A* be a set.

**Definition 10.3.1.1.1.** A relation R on A is **symmetric** if we have  $R^{\dagger} = R$ .

**Remark 10.3.1.1.2.** In detail, a relation R is symmetric if it satisfies the following condition:

 $(\star)$  For each  $a, b \in A$ , if  $a \sim_R b$ , then  $b \sim_R a$ .

**Definition 10.3.1.1.3.** Let *A* be a set.

- 1. The **set of symmetric relations on** A is the subset  $Rel^{symm}(A, A)$  of Rel(A, A) spanned by the symmetric relations.
- 2. The **poset of relations on** A is is the subposet  $Rel^{symm}(A, A)$  of Rel(A, A) spanned by the symmetric relations.

**Proposition 10.3.1.1.4.** Let R and S be relations on A.

- 1. Interaction With Inverses. If R is symmetric, then so is  $R^{\dagger}$ .
- 2. *Interaction With Composition.* If R and S are symmetric, then so is  $S \diamond R$ .

Proof. Item 1, Interaction With Inverses: Clear. Item 2, Interaction With Composition: Clear.

### 10.3.2 The Symmetric Closure of a Relation

Let R be a relation on A.

**Definition 10.3.2.1.1.** The **symmetric closure** of  $\sim_R$  is the relation  $\sim_R^{\text{symm}_5}$  satisfying the following universal property:<sup>6</sup>

(\*) Given another symmetric relation  $\sim_S$  on A such that  $R \subset S$ , there exists an inclusion  $\sim_R^{\text{symm}} \subset \sim_S$ .

**Construction 10.3.2.1.2.** Concretely,  $\sim_R^{\text{symm}}$  is the symmetric relation on A defined by

$$R^{\text{symm}} \stackrel{\text{def}}{=} R \cup R^{\dagger}$$
  
=  $\{(a, b) \in A \times A \mid \text{we have } a \sim_R b \text{ or } b \sim_R a\}.$ 

Proof. Clear.

**Proposition 10.3.2.1.3.** Let R be a relation on A.

1. Adjointness. We have an adjunction

$$((-)^{\operatorname{symm}} \dashv \overline{\Xi}): \operatorname{Rel}(A, A) \underbrace{\bot}_{\Xi} \operatorname{Rel}^{\operatorname{symm}}(A, A),$$

witnessed by a bijection of sets

$$Rel^{symm}(R^{symm}, S) \cong Rel(R, S),$$

natural in  $R \in \text{Obj}(\mathbf{Rel}^{\mathsf{symm}}(A, A))$  and  $S \in \text{Obj}(\mathbf{Rel}(A, A))$ .

- 2. The Symmetric Closure of a Symmetric Relation. If R is symmetric, then  $R^{\text{symm}} = R$ .
- 3. Idempotency. We have

$$(R^{\text{symm}})^{\text{symm}} = R^{\text{symm}}.$$

<sup>&</sup>lt;sup>5</sup> Further Notation: Also written  $R^{\text{symm}}$ .

<sup>&</sup>lt;sup>6</sup> Slogan: The symmetric closure of R is the smallest symmetric relation containing R.

4. Interaction With Inverses. We have

$$\left(R^{\dagger}\right)^{\operatorname{symm}} = \left(R^{\operatorname{symm}}\right)^{\dagger}, \qquad \stackrel{(-)^{\operatorname{symm}}}{\bigoplus} \ \operatorname{Rel}(A,A) \\ \operatorname{Rel}(A,A) \xrightarrow[(-)^{\operatorname{symm}}]{} \operatorname{Rel}(A,A).$$

5. Interaction With Composition. We have

$$\mathsf{Rel}(A,A) \times \mathsf{Rel}(A,A) \xrightarrow{\diamond} \mathsf{Rel}(A,A)$$

$$(S \diamond R)^{\mathsf{symm}} = S^{\mathsf{symm}} \diamond R^{\mathsf{symm}}, \qquad \underset{(-)^{\mathsf{symm}} \times (-)^{\mathsf{symm}}}{\underbrace{\downarrow}} \qquad \qquad \underset{(-)^{\mathsf{symm}}}{\underbrace{\downarrow}} \qquad \qquad \underset{(-)^{\mathsf{symm}}}{\underbrace{\downarrow}} \qquad \qquad \underset{(-)^{\mathsf{symm}}}{\underbrace{\downarrow}} \qquad \qquad \underset{(-)^{\mathsf{symm}}}{\underbrace{\downarrow}} \qquad \qquad \mathsf{Rel}(A,A).$$

*Proof. Item* 1, *Adjointness*: This is a rephrasing of the universal property of the symmetric closure of a relation, stated in Definition 10.3.2.1.1.

Item 2, The Symmetric Closure of a Symmetric Relation: Clear.

*Item* 3, *Idempotency*: This follows from Item 2.

Item 4, Interaction With Inverses: Clear.

Item 5, Interaction With Composition: This follows from Item 2 of Definition 10.3.1.1.4.

## 10.4 Transitive Relations

### 10.4.1 Foundations

Let A be a set.

**Definition 10.4.1.1.1.** A transitive relation is equivalently:<sup>7</sup>

- · A non-unital  $\mathbb{E}_1$ -monoid in  $(N_{\bullet}(\text{Rel}(A, A)), \diamond)$ .
- · A non-unital monoid in ( $\mathbf{Rel}(A, A), \diamond$ ).

<sup>&</sup>lt;sup>7</sup>Note that since Rel(A, A) is posetal, transitivity is a property of a relation, rather than extra structure.

**Remark 10.4.1.1.2.** In detail, a relation *R* on *A* is **transitive** if we have an inclusion

$$\mu_R: R \diamond R \subset R$$

of relations in  $\operatorname{Rel}(A, A)$ , i.e. if, for each  $a, c \in A$ , the following condition is satisfied:

 $(\star)$  If there exists some  $b \in A$  such that  $a \sim_R b$  and  $b \sim_R c$ , then  $a \sim_R c$ .

### **Definition 10.4.1.1.3.** Let *A* be a set.

- 1. The **set of transitive relations from** A **to** B is the subset  $Rel^{trans}(A)$  of Rel(A, A) spanned by the transitive relations.
- 2. The **poset of relations from** A **to** B is is the subposet  $Rel^{trans}(A)$  of Rel(A, A) spanned by the transitive relations.

**Proposition 10.4.1.1.4.** Let *R* and *S* be relations on *A*.

- 1. *Interaction With Inverses.* If R is transitive, then so is  $R^{\dagger}$ .
- 2. Interaction With Composition. If R and S are transitive, then  $S \diamond R$  may fail to be transitive.

Proof. Item 1, Interaction With Inverses: Clear.

Item 2, Interaction With Composition: See [MSE 2096272].8

### 10.4.2 The Transitive Closure of a Relation

Let R be a relation on A.

- There is some  $b \in A$  such that:

\* 
$$a \sim_R b$$
;

\* 
$$b \sim_S c$$
;

- There is some  $d \in A$  such that:

\* 
$$c \sim_R d$$
;

<sup>&</sup>lt;sup>8</sup> *Intuition*: Transitivity for R and S fails to imply that of  $S \diamond R$  because the composition operation for relations intertwines R and S in an incompatible way:

<sup>·</sup> If  $a \sim_{S \diamond R} c$  and  $c \sim_{S \diamond r} e$ , then:

<sup>\*</sup>  $d \sim_S e$ .

**Definition 10.4.2.1.1.** The **transitive closure** of  $\sim_R$  is the relation  $\sim_R^{\text{trans9}}$  satisfying the following universal property:<sup>10</sup>

 $(\star)$  Given another transitive relation  $\sim_S$  on A such that  $R \subset S$ , there exists an inclusion  $\sim_R^{\mathsf{trans}} \subset \sim_S$ .

**Construction 10.4.2.1.2.** Concretely,  $\sim_R^{\text{trans}}$  is the free non-unital monoid on R in  $(\text{Rel}(A,A),\diamond)^{11}$ , being given by

$$R^{\text{trans}} \stackrel{\text{def}}{=} \coprod_{n=1}^{\infty} R^{\diamond n}$$

$$\stackrel{\text{def}}{=} \bigcup_{n=1}^{\infty} R^{\diamond n}$$

$$\stackrel{\text{def}}{=} \left\{ (a,b) \in A \times B \middle| \text{ there exists some } (x_1,\ldots,x_n) \in R^{\times n} \\ \text{such that } a \sim_R x_1 \sim_R \cdots \sim_R x_n \sim_R b \right\}.$$

Proof. Clear.

**Proposition 10.4.2.1.3.** Let R be a relation on A.

1. Adjointness. We have an adjunction

$$((-)^{\text{trans}} \dashv \overline{\Xi}): \text{Rel}(A, A) \underbrace{\downarrow}_{\Xi} \text{Rel}^{\text{trans}}(A, A),$$

witnessed by a bijection of sets

$$\mathbf{Rel}^{\mathsf{trans}}(R^{\mathsf{trans}}, S) \cong \mathbf{Rel}(R, S),$$

natural in  $R \in \text{Obj}(\text{Rel}^{\text{trans}}(A, A))$  and  $S \in \text{Obj}(\text{Rel}(A, B))$ .

- 2. The Transitive Closure of a Transitive Relation. If R is transitive, then  $R^{\text{trans}} = R$ .
- 3. Idempotency. We have

$$(R^{\text{trans}})^{\text{trans}} = R^{\text{trans}}.$$

<sup>&</sup>lt;sup>9</sup> Further Notation: Also written R<sup>trans</sup>.

 $<sup>^{10}</sup>$  Slogan: The transitive closure of R is the smallest transitive relation containing R.

<sup>&</sup>lt;sup>11</sup>Or, equivalently, the free non-unital  $\mathbb{E}_1$ -monoid on R in  $(N_{\bullet}(Rel(A, A)), \diamond)$ .

4. Interaction With Inverses. We have

$$\left(R^{\dagger}\right)^{\text{trans}} = \left(R^{\text{trans}}\right)^{\dagger}, \qquad \underset{(-)^{\dagger}}{\stackrel{(-)^{\text{trans}}}{\bigoplus}} \ \operatorname{Rel}(A,A) \\ \operatorname{Rel}(A,A) \xrightarrow{(-)^{\text{trans}}} \ \operatorname{Rel}(A,A).$$

5. Interaction With Composition. We have

$$(S \diamond R)^{\mathrm{trans}} \overset{\mathrm{poss.}}{\neq} S^{\mathrm{trans}} \diamond R^{\mathrm{trans}}, \qquad (-)^{\mathrm{trans}} \times (-)^{\mathrm{$$

*Proof. Item* 1, *Adjointness*: This is a rephrasing of the universal property of the transitive closure of a relation, stated in Definition 10.4.2.1.1.

Item 2, The Transitive Closure of a Transitive Relation: Clear.

Item 3, Idempotency: This follows from Item 2.

Item 4, Interaction With Inverses: We have

$$(R^{\dagger})^{\text{trans}} = \bigcup_{n=1}^{\infty} (R^{\dagger})^{\diamond n}$$

$$= \bigcup_{n=1}^{\infty} (R^{\diamond n})^{\dagger}$$

$$= (R^{\text{trans}})^{\dagger},$$

where we have used, respectively:

- Definition 10.4.2.1.2.
- · Constructions With Relations, ?? of ??.
- · Constructions With Relations, ?? of Definition 9.2.3.1.2.

Definition 10.4.2.1.2.

This finishes the proof.

Item 5, Interaction With Composition: This follows from Item 2 of Definition 10.4.1.1.4.

# 10.5 Equivalence Relations

### 10.5.1 Foundations

Let A be a set.

**Definition 10.5.1.1.1.** A relation R is an **equivalence relation** if it is reflexive, symmetric, and transitive. <sup>12</sup>

**Example 10.5.1.1.2.** The **kernel of a function**  $f: A \to B$  is the equivalence relation  $\sim_{\mathsf{Ker}(f)}$  on A obtained by declaring  $a \sim_{\mathsf{Ker}(f)} b$  iff f(a) = f(b).

**Definition 10.5.1.1.3.** Let *A* and *B* be sets.

- 1. The **set of equivalence relations from** A **to** B is the subset  $Rel^{eq}(A, B)$  of Rel(A, B) spanned by the equivalence relations.
- 2. The **poset of relations from** A **to** B is is the subposet  $Rel^{eq}(A, B)$  of Rel(A, B) spanned by the equivalence relations.

# 10.5.2 The Equivalence Closure of a Relation

Let R be a relation on A.

**Definition 10.5.2.1.1.** The **equivalence closure**<sup>14</sup> of  $\sim_R$  is the relation  $\sim_R^{\text{eq}_{15}}$  satisfying the following universal property:<sup>16</sup>

<sup>&</sup>lt;sup>12</sup> Further Terminology: If instead R is just symmetric and transitive, then it is called a **partial equivalence relation**.

<sup>&</sup>lt;sup>13</sup>The kernel  $Ker(f): A \rightarrow A$  of f is the underlying functor of the monad induced by the adjunction  $Cr(f) \dashv f^{-1}: A \rightleftharpoons B$  in **Rel** of Constructions With Relations, ?? of ??.

<sup>&</sup>lt;sup>14</sup> Further Terminology: Also called the **equivalence relation associated to**  $\sim_R$ .

<sup>&</sup>lt;sup>15</sup> Further Notation: Also written  $R^{eq}$ .

 $<sup>^{16}</sup>$  Slogan: The equivalence closure of R is the smallest equivalence relation containing R.

 $(\star)$  Given another equivalence relation  $\sim_S$  on A such that  $R \subset S$ , there exists an inclusion  $\sim_R^{\text{eq}} \subset \sim_S$ .

**Construction 10.5.2.1.2.** Concretely,  $\sim_R^{\text{eq}}$  is the equivalence relation on A defined by

$$R^{\text{eq}} \stackrel{\text{def}}{=} \left( \left( R^{\text{refl}} \right)^{\text{symm}} \right)^{\text{trans}}$$

$$= \left( \left( R^{\text{symm}} \right)^{\text{trans}} \right)^{\text{refl}}$$

$$= \left\{ (a,b) \in A \times B \middle| \begin{array}{c} \text{there exists } (x_1,\ldots,x_n) \in R^{\times n} \text{ satisfying at least one of the following conditions:} \\ 1. \text{ The following conditions are satisfied:} \\ (a) \text{ We have } a \sim_R x_1 \text{ or } x_1 \sim_R a; \\ (b) \text{ We have } x_i \sim_R x_{i+1} \text{ or } x_{i+1} \sim_R x_i \\ \text{ for each } 1 \leq i \leq n-1; \\ (c) \text{ We have } b \sim_R x_n \text{ or } x_n \sim_R b; \\ 2. \text{ We have } a = b. \end{array} \right\}.$$
The following conditions are satisfied:
$$(a) \text{ We have } x_i \sim_R x_{i+1} \text{ or } x_{i+1} \sim_R x_i \\ \text{ for each } 1 \leq i \leq n-1; \\ (c) \text{ We have } b \sim_R x_n \text{ or } x_n \sim_R b; \\ 2. \text{ We have } a = b.$$
The following conditions are satisfied:
$$(a) \text{ We have } x_i \sim_R x_{i+1} \text{ or } x_{i+1} \sim_R x_i \\ \text{ for each } 1 \leq i \leq n-1; \\ \text{ (c) We have } a = b.$$
The following conditions are satisfied:
$$(a) \text{ We have } x_i \sim_R x_{i+1} \text{ or } x_{i+1} \sim_R x_i \\ \text{ for each } 1 \leq i \leq n-1; \\ \text{ (c) We have } a = b.$$
The following conditions are satisfied:
$$(a) \text{ We have } x_i \sim_R x_{i+1} \text{ or } x_{i+1} \sim_R x_i \\ \text{ for each } 1 \leq i \leq n-1; \\ \text{ (c) We have } a = b.$$
The following conditions are satisfied:
$$(a) \text{ We have } x_i \sim_R x_{i+1} \text{ or } x_i \sim_R x_i \\ \text{ (c) We have } x_i \sim_R x_i \sim_R x_i \\ \text{ (c) We have } x_i \sim_R x_i \sim_R x_i <_R x_$$

*Proof.* From the universal properties of the reflexive, symmetric, and transitive closures of a relation (Definitions 10.2.2.1.1, 10.3.2.1.1 and 10.4.2.1.1), we see that it suffices to prove that:

- 1. The symmetric closure of a reflexive relation is still reflexive.
- 2. The transitive closure of a symmetric relation is still symmetric.

which are both clear. 

**Proposition 10.5.2.1.3.** Let R be a relation on A.

1. Adjointness. We have an adjunction

$$((-)^{eq} + \overline{k}): \operatorname{Rel}(A, B) \underbrace{\downarrow}_{\overline{k}} \operatorname{Rel}^{eq}(A, B),$$

witnessed by a bijection of sets

$$Rel^{eq}(R^{eq}, S) \cong Rel(R, S),$$

natural in  $R \in \text{Obj}(\mathbf{Rel}^{eq}(A, B))$  and  $S \in \text{Obj}(\mathbf{Rel}(A, B))$ .

- 2. The Equivalence Closure of an Equivalence Relation. If R is an equivalence relation, then  $R^{eq} = R$ .
- 3. Idempotency. We have

$$(R^{eq})^{eq} = R^{eq}$$
.

*Proof. Item* 1, *Adjointness*: This is a rephrasing of the universal property of the equivalence closure of a relation, stated in Definition 10.5.2.1.1.

Item 2, The Equivalence Closure of an Equivalence Relation: Clear.

Item 3, Idempotency: This follows from Item 2.

# 10.6 Quotients by Equivalence Relations

# 10.6.1 Equivalence Classes

Let A be a set, let R be a relation on A, and let  $a \in A$ .

**Definition 10.6.1.1.1.** The **equivalence class associated to** a is the set [a] defined by

$$[a] \stackrel{\text{def}}{=} \{x \in X \mid x \sim_R a\}$$

$$= \{x \in X \mid a \sim_R x\}.$$
 (since *R* is symmetric)

# 10.6.2 Quotients of Sets by Equivalence Relations

Let *A* be a set and let *R* be a relation on *A*.

**Definition 10.6.2.1.1.** The **quotient of** X **by** R is the set  $X/\sim_R$  defined by

$$X/\sim_R \stackrel{\text{def}}{=} \{[a] \in \mathcal{P}(X) \mid a \in X\}.$$

**Remark 10.6.2.1.2.** The reason we define quotient sets for equivalence relations only is that each of the properties of being an equivalence relation—reflexivity, symmetry, and transitivity—ensures that the equivalences classes [a] of X under R are well-behaved:

· Reflexivity. If R is reflexive, then, for each  $a \in X$ , we have  $a \in [a]$ .

· Symmetry. The equivalence class [a] of an element a of X is defined by

$$[a] \stackrel{\text{def}}{=} \{x \in X \mid x \sim_R a\},\$$

but we could equally well define

$$[a]' \stackrel{\text{def}}{=} \{x \in X \mid a \sim_R x\}$$

instead. This is not a problem when R is symmetric, as we then have [a] = [a]'.<sup>17</sup>

• Transitivity. If R is transitive, then [a] and [b] are disjoint iff  $a \not\sim_R b$ , and equal otherwise.

**Proposition 10.6.2.1.3.** Let  $f: X \to Y$  be a function and let R be a relation on X.

1. As a Coequaliser. We have an isomorphism of sets

$$X/\sim_R^{\operatorname{eq}}\cong\operatorname{CoEq}\Biggl(R\hookrightarrow X imes X\overset{\operatorname{pr}_1}{\underset{\operatorname{pr}_2}{ o}}X\Biggr),$$

where  $\sim_R^{\text{eq}}$  is the equivalence relation generated by  $\sim_R$ .

2. As a Pushout. We have an isomorphism of sets<sup>18</sup>

$$X/\sim_R^{\operatorname{eq}} \cong X \coprod_{\operatorname{Eq}(\operatorname{pr}_1,\operatorname{pr}_2)} X, \qquad \bigwedge^{\operatorname{rq}} \qquad X$$

$$X/\sim_R^{\operatorname{eq}} \hookrightarrow X \qquad \bigwedge \qquad \bigwedge \qquad X \leftarrow \operatorname{Eq}(\operatorname{pr}_1,\operatorname{pr}_2).$$

where  $\sim_R^{\text{eq}}$  is the equivalence relation generated by  $\sim_R$ .

$$\operatorname{Eq}(\operatorname{pr}_1,\operatorname{pr}_2)\cong X\times_{X/\sim_R^{\operatorname{eq}}}X, \qquad \qquad \bigcup_{\stackrel{\,\,\smile}{}} \qquad \qquad \bigcup_{\stackrel{\,\,\smile}{}} \qquad \qquad \downarrow$$
 
$$X\longrightarrow X/\sim_R^{\operatorname{eq}}$$

<sup>&</sup>lt;sup>17</sup>When categorifying equivalence relations, one finds that [a] and [a]' correspond to presheaves and copresheaves; see Constructions With Categories, ??.

<sup>&</sup>lt;sup>18</sup>Dually, we also have an isomorphism of sets

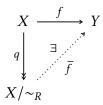

3. The First Isomorphism Theorem for Sets. We have an isomorphism of sets 19,20

$$X/\sim_{\mathsf{Ker}(f)} \cong \mathsf{Im}(f).$$

- 4. Descending Functions to Quotient Sets, I. Let R be an equivalence relation on X. The following conditions are equivalent:
  - (a) There exists a map

$$\overline{f}: X/\sim_R \to Y$$

making the diagram

commute.

- (b) We have  $R \subset \text{Ker}(f)$ .
- (c) For each  $x, y \in X$ , if  $x \sim_R y$ , then f(x) = f(y).
- 5. Descending Functions to Quotient Sets, II. Let R be an equivalence relation on

$$\operatorname{Ker}(f): X \to X,$$
  
 $\operatorname{Im}(f) \subset Y$ 

of f are the underlying functors of (respectively) the induced monad and comonad of the adjunction

$$(\operatorname{Gr}(f) \dashv f^{-1}): A \xrightarrow{\operatorname{Gr}(f)} B$$

of Constructions With Relations, ?? of ??.

<sup>&</sup>lt;sup>19</sup> Further Terminology: The set  $X/\sim_{\mathsf{Ker}(f)}$  is often called the **coimage of** f, and denoted by  $\mathsf{Colm}(f)$ .

 $<sup>^{\</sup>rm 20}$  In a sense this is a result relating the monad in  $\bf ReI$  induced by f with the comonad in  $\bf ReI$  induced by f , as the kernel and image

X. If the conditions of Item 4 hold, then  $\overline{f}$  is the unique map making the diagram

commute.

6. Descending Functions to Quotient Sets, III. Let R be an equivalence relation on X. We have a bijection

$$\operatorname{\mathsf{Hom}}_{\mathsf{Sets}}(X/{\sim_R},Y) \cong \operatorname{\mathsf{Hom}}^R_{\mathsf{Sets}}(X,Y),$$

natural in  $X,Y\in {\rm Obj}({\rm Sets})$ , given by the assignment  $f\mapsto \overline{f}$  of Items 4 and 5, where  ${\rm Hom}_{{\rm Sets}}^R(X,Y)$  is the set defined by

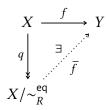

$$\operatorname{Hom}_{\mathsf{Sets}}^R(X,Y) \stackrel{\mathrm{def}}{=} \left\{ f \in \operatorname{Hom}_{\mathsf{Sets}}(X,Y) \middle| \begin{array}{l} \text{for each } x,y \in X, \\ \text{if } x \sim_R y, \text{ then} \\ f(x) = f(y) \end{array} \right\}.$$

- 7. Descending Functions to Quotient Sets, IV. Let R be an equivalence relation on X. If the conditions of Item 4 hold, then the following conditions are equivalent:
  - (a) The map  $\overline{f}$  is an injection.
  - (b) We have R = Ker(f).
  - (c) For each  $x, y \in X$ , we have  $x \sim_R y$  iff f(x) = f(y).
- 8. Descending Functions to Quotient Sets, V. Let R be an equivalence relation on X. If the conditions of Item 4 hold, then the following conditions are equivalent:
  - (a) The map  $f: X \to Y$  is surjective.
  - (b) The map  $\overline{f}: X/\sim_R \to Y$  is surjective.
- 9. Descending Functions to Quotient Sets, VI. Let R be a relation on X and let  $\sim_R^{eq}$  be the equivalence relation associated to R. The following conditions are equivalent:
  - (a) The map f satisfies the equivalent conditions of Item 4:

· There exists a map

$$\overline{f}: X/\sim_R^{\mathsf{eq}} \to Y$$

making the diagram

commute.

- · For each  $x, y \in X$ , if  $x \sim_R^{eq} y$ , then f(x) = f(y).
- (b) For each  $x, y \in X$ , if  $x \sim_R y$ , then f(x) = f(y).

Proof. Item 1, As a Coequaliser: Omitted.

Item 2, As a Pushout: Omitted.

Item 3, The First Isomorphism Theorem for Sets: Clear.

Item 4, Descending Functions to Quotient Sets, I: See [Pro25c].

*Item* 5, Descending Functions to Quotient Sets, II: See [Pro25d].

Item 6, Descending Functions to Quotient Sets, III: This follows from Items 5 and 6.

Item 7, Descending Functions to Quotient Sets, IV: See [Pro25b].

Item 8, Descending Functions to Quotient Sets, V: See [Pro25a].

Item 9, Descending Functions to Quotient Sets, VI: The implication Item 8a  $\implies$  Item 8b is clear.

Conversely, suppose that, for each  $x, y \in X$ , if  $x \sim_R y$ , then f(x) = f(y). Spelling out the definition of the equivalence closure of R, we see that the condition  $x \sim_R^{\text{eq}} y$  unwinds to the following:

- (\*) There exist  $(x_1, \ldots, x_n) \in R^{\times n}$  satisfying at least one of the following conditions:
  - The following conditions are satisfied:
    - \* We have  $x \sim_R x_1$  or  $x_1 \sim_R x$ ;
    - \* We have  $x_i \sim_R x_{i+1}$  or  $x_{i+1} \sim_R x_i$  for each  $1 \leq i \leq n-1$ ;
    - \* We have  $y \sim_R x_n$  or  $x_n \sim_R y$ ;
  - We have x = y.

Now, if x = y, then f(x) = f(y) trivially; otherwise, we have

$$f(x) = f(x_1),$$

$$f(x_1) = f(x_2),$$

$$\vdots$$

$$f(x_{n-1}) = f(x_n),$$

$$f(x_n) = f(y),$$

and f(x) = f(y), as we wanted to show.
